> Bullshit.

I love it. When you can't offer a rational rebuttal use profanity.

Now back to the ORIGINAL POINT of this. The key phrase is imminent
danger of loss of life (or property). Large traffic accident? Bodies laying
about? Blocking traffic lanes? Vehicle burning? Use whatever means available
to call for assistance. Car ran out of gas because you thought that E means
enough? Car won't start in the parking lot because you left all the radios
turned on while shopping? You are getting hungry and a pizza would really
hit the spot? Sorry, that's not imminent loss of life time. Get on the radio,
tell you friends or call your wife and tell her you'll be a bit late.

Why is it everyone tries to ignore rules or find loop holes?

If you simply checkout Part 97 you will find the following:

97.115 Music prohibited.

The transmission of music by an amateur station is forbidden.

Now, how simple can you get! It didn't list any exceptions (autopatch music, etc.). It doesn't allow *any* room for interpretation. It doesn't say *broadcast* it says *transmission* of music. So, until the rules are changed, let's try to abide by them.

>any general guidelines for looking for a used repeater for this frequency or
>specific brands or models to look for/avoid?

The best deal I ever saw on a commercial repeater at a hamfest was a brand new in the box Motorola Radius repeater (10 watt) complete with duplexer and 300 feet of hardline for $600 at Dayton last year. Normally you won't find a complete repeater at hamfests, certainly not current generation equipment.

What you will find is a host of Motorola Micor, Mitrek, and the like commercial radios, plus a smattering of GE, RCA, Johnson, and other makes. If these haven't been hacked too badly, you can often *make* a repeater using their receiver and transmitter strips with a third party controller and a good duplexer. There will be a lot of older retired equipment, much of it tube type, available as well. This junk should likely be avoided for a commercial repeater installation. I saw a complete pre-Progress line GE repeater at the last hamfest I attended. It filled a six foot rack and the guy wanted $200 for it. There were no takers. New commercial band repeaters from commercial vendors go for $1200 to $1800 and up for 10 watt units. High power units cost more due to the extra amplifier and the stricter tolerances on the required duplexer. Unless your friend has the services of a skilled technician, he should probably stick with these.

My R5 & R7's both are VERY sensitive to close trees!
My trees are 4 meters away and it effects resonance
just as reported by the others!

I still like the antenna however!

After replying to D. Jenkins' posting about business traffic,
I noticed his posting was quite old. We're having trouble
getting anything from Usenet right now, so we aren't
seeing postings made after about Wednesday, July 22. Direct
e-mail MAY be getting through, but I haven't seen any in
a few days.

If you've sent e-mail to ARRL, or have made a posting you
feel we should respond to, this outage will explain why
you haven't heard from us. I THINK outgoing mail and
postings from here are getting through. Rest assured,
once the problem is resolved, we'll be back in force!

Ray, Ray, Ray, lighten up!
If you are walking down the street yappin on your HT to your buddy AB4YZ and some kid runs by and screams at his amigo "F**k you !%&%^%$^" and your mike, being so sensitive, picks this up and transmits this profanity to the world, including your friendly FCC monitoring station down the street, are you telling me that, by your simplistic way of reading the rule book, you'd pay the fine and go to jail since it was your call that the friendly FCC monitor wrote down?????
Or lets say that the same kid does not yell out a profanity but walks by with his boombox blasting and your conversation has "Santana" playing in the backround over the airwaves, what then???

I don't see any room for interpretation on these, do you?

Hugo, N6YWH

1152. NC/SC HAMFEST INFO MAILING LIST ANNOUNCEMENT

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-24 18:15:23 UTC
From: cs00jmc@unccvax.uncc.edu
Message-ID: <9207241814.AA11766@unccvax>
Source record: 286919

(I don't think this got through, so I'll try again)

NC/SC HAMFEST INFO MAILING LIST ANNOUNCEMENT

I have been maintaining an electronic mailing list for the last year and
a half, and thought that there might be a few people on the net that
would like to know about it. I posted an announcement a year ago but
a lot of new people are on the net so I thought I would post another
announcement.

This list describes hamfests in North and South Carolina, and is updated
as needed, usually about once a month. I have included a few hamfests
outside of the Carolinas that may be of interest.

The list has a calendar of hamfest dates and locations for the
rest of the year; and a few paragraphs about each hamfest that
will take place during the next month. I try to include
info about the hamfest location, whether exams are offerred,
ticket pricing, "more info" addresses, and sometimes brief remarks
about the hamfest based on my personal experience.

I developed this list to answer e-mail questions I received from
people ("Are there any hamfests in this area in the near future?"),
especially non-hams who often don't hear about the hamfests otherwise.
However, there are hams who read it as well, since I try to combine
information from multiple sources into a simple, quickly read message.

I have been posting this information to the triangle.radio newsgroup
for the last 2 months, but I can't guarantee that I will be able to
do that after the end of the year. I don't post it to rec.radio.amateur.misc
or other national/international groups on a regular basis
since the information is only useful to a small part of the country,
and due to the flamage that might result.

So if you need hamfest information for North and South Carolina
and would like to be put on the e-mail list, contact me at
cs00jmc@unccvax.uncc.edu or 3426957@mcimail.com
and I will add you to the list!

> When I hear people starting to get shrill about getting youngsters
> involved in ham radio, I often take note, especially when they start
> talking about CW being an obsticle. I think this problem with the
> heavy language is much more of an issue than CW for kids. CW is

I have to agree. I have three kids that have received licenses. The code was not a significant problem - it just took some time. None of them understood the theory. I spent a lot of time with them trying to put it in terms that they could handle. It was not easy, and very frustrating. The kids had no problem understanding why they had to memorize the code. But, they ended up memorizing the answers to the question pool and didn't understand what the benefit of that was.

It is legal, and there are some simplex autopatches available commercially.

Perhaps the bogosity statement is true WRT Apple monitors (having NO
experience with same), HOWEVER! - I have a really nice Magnavox Multisync
monitor at home that plays HAVOC with the ENTIRE 10M novice SSB portion
pretty much whenever its on (severity depends upon whats on the display -
you can sometimes tell when the scene changes by what happens on the radio!).

>....

>Indeed, the whole lot is FCC Class B certified. I doubt you could say
>the same for Suns or ATT workstations.

My PC is class B (including the monitor, I think - now I'm going to
have to check!), but that does not alter the fact that 10m is pretty
much useless when I have the computer on...

You say you've got it tough?

When I was a novice, we didn't have telegraph keys;

We ran A-0 emission, plugged our transmitters into the
switched wall outlet, and stood by the doorway, toggling
the light switch.

I tell yah - it was rough!

Light switches? Looxury, lad, looxury! We had to get up at 6 a.m.
and carve cats' whiskers out of blocks of galena. Then our dad would
make us grind lumps of graphite to make headphones. Then we had to
operate the treadmill to charge up the batteries. We really had to
shout to make ourselves heard in the next county with those rigs -
I was glad when they invented the microphone, I can tell 'ee, lad.
Tell that to the young people of today, they just won't believe you.

Philip -

To turn off the alarm:

Press TIMER so that STANDBY does not appear on the display.

To get a manual:

Go to any Radio Shack store and ask them to order one for
you. Or, call Tandy National Parts at 817-870-5600 and
you can order one direct using your credit card. You will
need to tell them the catalog number of the unit. This
number is 20-221x--where x is the letter following the
catalog number on the unit's rating label. Actually,
there were very minor changes to the O/M between versions,
so any version would work for you.

*----
I favor motorola. Does your friend know what he's getting into?
Finding a used repeater is easy. Setting it up for the right
frequency may not be. And he'd better remember to get an
appropriate duplexer too; it may cost as much as the repeater.

>>willingly entering into.

I'm not a lawyer but it was my understanding that any provisions in a
contract that violate the law are invalid. I seem to recall a while back
when CC&R's existed that had provisions that said you couldn't sell a
house to people of certain races. These provisions were declared invalid
because they violated laws against discrimination.

Wouldn't similar reasoning work for CC&R's that attempt to restrict antenna
height since they prevent you from installing an antenna as provided for by
Federal law? What we need is a sharp lawyer on our side :-)

You call that tough? That's nothing!

We had it so bad that we ran 0-0 emission. We would stand on our roofs,
put our hands to our mouths and scream out our dit dahs!!! I tell ya mac
you aint' heard nothing 'till you hear some guy scream dah d... and you
knew some poor sap either lost his voice or fell off his roof. That'll send
chills down your spine!

1167. Help for a damaged VHF antenna

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-25 01:26:13 UTC
From: calinski@calspan.com
Message-ID: <calinski.712027573@calspan.com>
Source record: 286860

My VHF marine radio was stolen recently. In the process they ripped the lead wire out of the antenna base. I worked my way into the wire opening and found that it seems the leadin was connected to a pair of coax wires. It seems that this pair of coax have the two center connectors soldered together and the two shields soldered together. I gather the leadin had it's center conductor tied to the antenna center conductors and the leadin shield tied to the antenna coax shields. I have three questions.

1. Am I right on the connection on the leadin to the antenna?

2. What type of coax was the leadin? 50 ohm or 75 etc?

3. Should I use any special type of coax for this marine environment?

The unit operated from 156.05 MHz to 157.425 Mhz at 25 watts.

Thanks in advance

Pete

Aiya! Batteries? What are those things? We had to make our own
Volta cells. Galena? Cat wiskers? We had to grind our own graphite
for the coherer!

On top of that, we had to work through all the QRM generated by
Guglielmo and Heinrich.

You young punks have it so easy!

1169. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-25 02:27:27 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Jul25.022727.24149@afit.af.mil>
Source record: 286840

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* KITSAT-A REPORT *
==================
By Jeff Ward, G0/K8KA

KOUROU, FRENCH GUIANA
20 JULY, 1992

Half way through the KITSAT-A launch campaign, spacecraft checkout has gone smoothly. All of the spacecraft subsystems and payloads have been tested, and other than finding a lizard in one of the tool boxes, there have been no surprises. Five engineers from Surrey Satellite Technology (UoSAT), six from Korean Institute of Science and Technology (KAIST) and a few from MATRA and CNES (France) are preparing two UoSAT-based microsatellites for launch.

One is KITSAT-A, which will provide a new CCD camera, a store-and-forward transponder, radiation experiments and digital signal processing facilities in the amateur satellite service. The second satellite is called "S80-T" and has been built commercially by the UoSAT/SSTL team at Surrey for MATRA Espace, a large French aerospace firm, who are in turn contracting for CNES, the French space agency. S80-T is not an amateur satellite, but will conduct experiments for CNES outside the amateur bands.

The launch campaign plan is much the same as that used on previous AMSAT launches with Ariane. The satellites and ground support equipment are flown into French Guiana's main airport in Cayanne, then transported to the "Centre Spatial Guianase" (CSG) which is about 100 km north up the coast near the city of Kourou. This is an outpost of highest technology between the jungle and the sea, with Devil's Island just off the coast.

At CSG, the team are given a clean room large enough to hold all the AMSAT spacecraft ever launched, but too small to be of any concern (or trouble) to the owners of the main payload. In this case, the primary satellite being launched is TOPEX/POSIEDON, an oceanographic survey mission jointly funded by

NASA and CNES.

Once set up in the clean room, the microsatellite team starts to systematically check out their satellites. For the UoSAT bus, this thorough checkout involves testing dozens of "back door" data paths which will only be used in emergencies, but which must nevertheless be tested. For KITSAT, we have also taken pictures with both CCD cameras, broadcast speech and data from the digital signal processing experiment, and taken background readings from the radiation monitor. These tests kept us occupied last week.

This week, the final physical preparations will be carried out. Inside the satellite, all cables and harnesses will be wrapped with special RFI shielding (known in French as "papier d'aluminium por les poulets roti"). The exterior surfaces of the satellite, used for thermal control, are also prepared. Each available area is covered by a tape with specific thermal characteristics. The heat absorption and radiation properties of these areas will keep the satellite within its temperature limits. This is particularly critical for the KITSAT orbit, which is sometimes in full sunlight, and sometimes 30% eclipsed.

Mechanical details - the preparation of cables to connect the satellite to the "Ariane Structure for Auxiliary Payloads" (ASAP) and the compression of the attach fitting spring which will eject KITSAT from the ASAP are also under way.

* SpaceNews NEWS *
==========
SpaceNews is generated each week with the intention of keeping the Amateur Radio community abreast of some of the latest developments in the Amateur Space Program. It is made available free of charge using electronic distribution means. SpaceNews is the effort of a single individual who has not and who cannot receive compensation for the service SpaceNews provides.

Recently, requests have been received asking for personal mailings or FAXs of SpaceNews to specific home or business addresses. Sorry, but this cannot be done. I also cannot FAX or return long distance telephone calls to answer specific satellite questions.

For those interested in joining a formal organization, I would suggest they join their local AMSAT organization. Membership in these organizations usually includes a newsletter which contains news and information that could answer many of the questions I receive on a regular basis.

* FEEDBACK/INPUT WELCOMED *

jdelancy@tecnet1.jcte.jcs.mil mentions:

>BTW, G8VUK went from no U.S. license to Extra class in less than
>a year..

Pshaw! G3WQO did it in one morning. And it took me a month because at first I thought you actually had to know the stuff on the advanced and extra class exams. But we're both too modest to mention it here :-)

Not since March of 1987. The Element 3 test was split into 3A and 3B.
After that date Technicians only need to take 3A.

-Ron

And it's MORSE, damn it!

> > > justify using the auto patch.
> >
> > Bullshit.
>
> I love it. When you can't offer a rational rebuttal use profanity.

I love it, when someone gives you a rational rebuttal, delete all but the first word of his response. The remainder of the post pointed out that being parked on the side of the highway is indeed an imminent loss of property or life situation. If you don't believe me (and I pointed out that I have experience with this) ask your local police department or the ARRL.

> Now back to the ORIGINAL POINT of this. The key phrase is imminent
> danger of loss of life (or property).

> Car ran out of gas because you thought that E means
> enough? Car won't start in the parking lot because you left all the radios
> turned on while shopping?

Parking lots, no. On the side of the highway, a stopped car for what ever reason (accident, break down, driver stupidity (forgot to get gas)), IS A DANGEROUS SITUATION for both the stranded driver and for other users of the road.

1176. RACES Bulletin #232

BID: $RACESBUL.232

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.232 DATE: July 27, 1992
SUBJECT: MGT: Administering the flow of responders

One vital task that befalls the telecommunications manager
during an emergency is to screen the communications volunteers
who respond; especially the intermittent flow of those that come
out of the woodwork at such times. It's not that they're not
wanted or needed, it's just that their usefulness may be other
than what they expect, depending on various factors. During an
emergency is NOT the time to train in such things as tactical
calls, the agency structure, proper identification, prowords, net
procedures, and other items learned only over time and practice.
However one may view it, the pressures on the Radio Officer,
staff, and operators can be far too great during an emergency
situation to put up with untrained operators or a partially
trained ego-centric know-it-all who inadvertently fouls up any
situation however well meaning.
Part of the value of training is that it alerts the manager
to these types in advance so adjustments can be made (including
specialized training) as appropriate. The aversion to training
by many people is natural for several reasons. Perhaps another
term should be used to emphasize that what is needed and benefi-
cial is simulated emergency activity on an on-going basis. This
insures that the practices and mindset so vital to emergency
operations become second nature and automatic.
That's the essential difference the Radio Officer or Emer-
gency Coordinator looks for -- the operator whose participation
and natural abilities are those that develop from actual partici-
pation and time in service. ---Cary Mangum, W6WWW

1177. DJ-580 antenna & mods

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-25 16:48:42 UTC
From: bryanw@IASTATE.EDU
Message-ID: <1992Jul25.114842@IASTATE.EDU>
Source record: 286855

I recently (yesterday) got a Alinco DJ-580 some of my friends told me that I would be better off with a different antenna on it. Any opinions or comments?

Also, if anyone had any mods to extend the range of the DJ-580, I would really appreciate it if you could e-mail me a copy, or where to get them.

Thanks for the help!

-Bryan Welch

Julian Macassey writes:

> Really? In fact the difference between a U.S. no-code
>Technician and a U.S. General is 13 wpm Morris. There is no futher test
>for General, but there is another test for Advanced.

Tech requires Element 2 and 3A
Tech Plus requires Element 1A, 2, and 3A
General requires Element 1B, 2, 3A, and 3B.

difference between a General and a Tech is 13 WPM and a written test.

before March 21, 1987 there was just 1 test for technician and general, but
that's history now. Of course anyone upgrading to general from the pre-1987
tech license gets credit for 3B if they can show they held the license before
that date.

Definitely 2 tests. 25 Q for Tech, 25 Q for General.

RTTY DX Notes 24 July
RTTY DX Notes for week ending 24 July, 1992 (BID RTDX0724)

This week has been quiet, with very little in the way of exciting DX,
though there have been one or two that stirred the blood a little.
But maybe it will be better next week.

The only real remarks that have been heard were about the bandplan I
mentioned last week. Some of the locals have been very terse. But
then I suppose that one should not make remarks about things that some
people know nothing about, and have not thought about. Oh well. You
cannot please everyone, I guess.

Our thanks this week go to I5FLN, IK5AAX, NT3B, SM5EIT, TG9VT, VK2EG,
WB2CJL and W2JGR and the Twin Cities DX Packet Cluster Network. Thank
you all for your help. I only wish at times I could see some of that
DX around my aerial.

Notes Of Interest.

D2/EA7EL will be in Angola for a month from July 23rd, and will be fairly active on RTTY. QSL to EA7EL.

TY1PS will be QRT for two weeks from August 1 thru August 18 while he has a short vacation.

FO0CI (Clipperton Island) has been accepted for DXCC by the ARRL. Cards for this operation are now being processed and should be in the mail shortly, we hope.

Cards for the S2/HA5BUS and the EP/HA5BUS operations are being printed. There is a possibility of them being in the mail in a month or so.

There has been no sign of Jim Smith from Kiribati. Maybe it is taking a little longer than anticipated.

1180. Comp.dcom.telecom Moderator attacks ham radio

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-25 23:03:03 UTC
From: pschleck@cwis.unomaha.edu
Message-ID: <pschleck.712105383@cwis>
Source record: 286859
Cross-posted to: rec.radio.amateur.misc,rec.radio.cb

The following caught my eye as a "Moderator's Note" in the moderated newsgroup comp.dcom.telecom. The moderator is Pat Towson, a notorious flame-baiter (as well as moderator of a great newsgroup, go figure...). It's probably just as well, he's insulted just about every *OTHER* sub-culture of loyal Telecom Digest readers, it was only a matter of time before he came to us.

The note was in response to a post by Cliff Stoll (K7TA) about how the Internet and the people who run it have to be a lot more street-smart with the invasion of crackers over the years. I agree with the points Cliff made, but Pat chimes in with this uncalled-for blow against ham radio:

>[Moderator's Note: Well Cliff, the Internet community had a lot of
>trust between people for many years until the BBS'er/malicious hacker
>type person found out about it and began abusing the trust. It reminds
>me of how ham radio *used* to be until the CB'ers started moving in. PAT]
^^^ ^^^ ^^^^^ ^^^^^^ ^^ ^^ ^^^^^ ^^^ ^^^^^^ ^^^^^^^ ^^^^^^ ^^

Yowch! If you'd like to give Pat a piece of your mind, address it to telecom@eecs.nwu.edu. He might even use it in his newsgroup.

KITSAT-A STATUS

HR AMSAT NEWS SERVICE BULLETIN 207.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 25, 1992 BID:$ANS-207.01
TO ALL RADIO AMATEURS BT

G0/K8KA Provides KITSAT-A Status From Kourou, French Guiana

Half way through the KITSAT-A launch campaign, the spacecraft checkout has gone smoothly. All of the spacecraft subsystems and payloads have been tested, and other than finding a lizard in one of the tool boxes, there have been no surprises. Five engineers from Surrey Satellite Technology (UoSAT), six from Korean Institute of Science and Technology (KAIST) and a few from MATRA and CNES (France) are preparing two UoSAT developed micro-satellites for launch.

KITSAT-A will possess a new CCD camera, a store-and-forward transponder, radiation experiments and digital signal processing facilities in the amateur satellite service. The second satellite is called "S80-T" was built commercially by the UoSAT/SSTL team at Surrey for MATRA Espace, a large French aerospace firm, who are in turn contracting for CNES, the French space agency. S80-T is not an amateur satellite, but will conduct experiments for CNES outside the amateur bands.

The launch campaign plan is much the same as that used on previous AMSAT launches with Ariane. The satellites and ground support equipment are flown into French Guiana's main airport in Cayenne, then transported to the "Centre Spatial Guianase" (CSG) which is about 100 km north up the coast near the city of Kourou. This is an outpost of highest technology between the jungle and the sea, with Devil's Island just off the coast.

At CSG, the teams are given a clean room large enough to hold all the AMSAT spacecraft ever launched, but too small to be of any concern (or trouble) to the owners of the main payload. In this case, the primary satellite being launched is TOPEX/POSEIDON, an oceanographic survey mission jointly funded by the NASA and CNES.

Once set up in the clean room, the microsatellite team starts to systematically check out their satellites. For the UoSAT bus, this thorough checkout involves testing dozens of "back door" data paths which will only be used in emergencies, but which must nevertheless be tested. For KITSAT, we have also taken pictures with both CCD cameras, broadcast speech and data from the digital signal processing experiment, and taken background readings from the radiation monitor. These tests kept us occupied last week.

This week, the final physical preparations will be carried out. Inside the satellite, all cables and harnesses will be wrapped with special RFI shielding (known in French as "papier d'aluminium por les poulets roti"). The exterior surfaces of the satellite -- used for thermal control -- are also prepared. Each available area is covered by a tape with specific thermal characteristics. The heat absorption and radiation properties of these areas will keep the satellite within its temperature limits. This is particularly critical for the KITSAT orbit, which is sometimes in full sunlight, and sometimes 30% eclipsed.

Mechanical details -- the preparation of cables to connect the satellite to the "Ariane Structure for Auxiliary Payloads" (ASAP) and the compression of the attach fitting spring which will eject KITSAT from the ASAP -- are also under way.

We now have 5 days to prepare the satellite for Monday's mating with the rocket. (Working on "le weekend" is frowned upon, and we move quickly during to week so that we can sample the delights of the jungle on Saturday and Sunday). If all goes smoothly, the satellites will both be ready to go on Friday night, and we will come in on Monday morning for the final activities. I will file a report later to bring you up to date -- if I can get a good data line to civilization.

Jeff Ward (G0/K8KA)

AMSAT-NA SPACE SYMPOSIUM INFO

HR AMSAT NEWS SERVICE BULLETIN 207.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 25, 1992 BID:$ANS-207.02
TO ALL RADIO AMATEURS BT

AMSAT-NA Space Symposium Scheduled For October 9-11th In Washington, D.C.

All individuals who are interested in space and amateur radio satellites are invited to attend this year's exciting AMSAT-NA Annual Meeting and Space Symposium to be held at the international headquarters of INTELSAT in Washington, D.C. It's a perfect opportunity to catch up on the latest developments in the design of Phase-3D as well as digital techniques for use on PACSATs and other amateur radio applications. The Space Symposium will be begin mid-day Friday, October 9, 1992 with registration, informal get-togethers and tutorials. In addition a special AMSAT/ARRL Education Workshop will be held on Friday afternoon and will be conducted by Rosalie White (WA1STO). A full schedule of talks for beginners, experienced users and other interested people will continue on Saturday, October 10th.

Saturday evening, following the "now famous" attitude readjustment hour, a banquet buffet will be served in the beautiful and spacious INTELSAT lobby. Also, you will get a chance to meet the new AMSAT-NA Board of Directors (BOD) during a question and answer session. In addition, those individuals who have made important contributions to AMSAT-NA during the past year will be recognized.

This is a perfect time of the year to spend some time with your family in our nation's capital discovering something of our past while looking into the future of amateur radio. For more information about lodging and registration, contact AMSAT-NA Headquarters at (301) 589-6062.
Those who have received your advanced registration form with the BOD ballot, can fax your registration in at (301) 608-3410.

AO-13 OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 207.03 FROM AMSAT HQ
SILVER SPRING, MD JULY 25, 1992 BID:$ANS-207.03
TO ALL RADIO AMATEURS BT

AMSAT-NA AO-13 Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and Mode J/L on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

1-Aug-92* 1500 B 57 VE2LVC W9ODI
8-Aug-92* 1900 B 65 W7NQM W5IU
15-Aug-92 1300 B 105 WB6LLO W9ODI
22-Aug-92 1435 J 55 WA5ZIB WJ9F

* Thanks to W9ODI for the off-pointing alert and subsequent change.

Guest commentators are planned. Join the Net if you have questions. In the unlikely event that either the Net Control Station (NCS) or the alternate NCS does not call on frequency, any participant is invited to act as the NCS.

****

Slow Scan Television On A0-13

The SSTV net will meet on a downlink frequency of 145.925 MHz, Mode B at MA 165, UTC Sundays. Also try Mode J, UTC Saturdays at MA 165, on a downlink frequency of 435.980 MHz. Try the various AMSAT Nets for scheduling at other times.

AO-13 Late Summer Schedule Announced

The current schedule for AO-13 is as follows:

```
N QST 1992 May 08 AO-13 Transponder Schedule Jun 10 - Jul 20
Mode-B : MA 000 to MA 165 ! Mode-JL on Mon, Wed !
Mode-JL : MA 165 to MA 200 ! Fri and Sat UTC only. ! Alon/Alat
Mode-LS : MA 200 to MA 215 ! S Beacon on "L" days ! 150/0
Mode-B : MA 215 to MA 256 ! S Transp on "B" days +----------/
Omnis : MA 250 to MA 060 ! Mode L OFF after Jun 29 until
Aug 17. Next attitude change Jul 20, to 150/0 until Sep 21.
73 de Peter DB2OS, James G3RUH and Graham VK5AGR.
```

--->PLEASE NOTE THAT AO-13 IS IN CONTINUOUS MODE B UNTIL AUGUST 17TH<---

```
AO-13 Transponder Schedule 1992 Aug 17 - Sep 21
----------------------------------------------------------------
Mode-B : MA 0 to MA 40 ! from 1992 Aug 17 until Sep 21
Mode-S : MA 40 to MA 50 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 50 to MA 55 !<- S beacon + L transponder
Mode-JL : MA 55 to MA 70 ! This schedule operates
Mode-B : MA 70 to MA 256 ! every orbit, every day.
Omnis : MA 160 to MA 10 ! Alon/Alat 150/0
Please DON'T uplink to Mode B MA during 40-50; it interferes with Mode S.
----------------------------------------------------------------

Calendar Of Events For AO-13 To The End Of 1992
-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-

1183. 1992 CSVHFS Summary - LONG

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-26 02:48:12 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9207260249.AA17095@cmr.ncsl.nist.gov>
Source record: 286868

The 1992 Central States VHF Society Conference
YO Hilton, Kerrville, TX, July 16-19, 1992
Summary

The 1992 Conference is history. The ham registration was 196, and at least 75 others took part in the family, teen, and infants activities. A number of the "family" attendees were hams - spouses or children of the "ham" attendees. Hams from G, VE, VK, ZL, XE, and about 30 states attended.

The conference started on Thursday afternoon with a tour of the Mooney Aircraft factory, one of the very few light-plane factories still operating in the USA. Thursday evening saw a joint meeting with the Hill Country Computer Club, featuring Bob, N4HY, talking about Digital Signal Processing and what it can do for you.

The Conference attendees were welcomed Friday morning by W3XO/5, 1992 CSVHFS prexy. Friday morning saw two simultaneous activities - the traditional antenna gain measurements and the first session of the "First VHF Ionospheric Propagation Conference" organized by N5JHV.

Antennas from 144 to 24 GHz were measured, using two ranges. A highlight was the portable !! 54-foot-boom beam for 2-meters brought by K6MYC. It beat all others, but was not eligible for a certificate, being a commercial product. Listen for W6JKV using it on future DXpeditions.

The ionospehric propagation session included a tutorial by W7CI; a talk on solar influences on VHF progagation by Norman Cohen from the Space Environmental Services Center in Boulder; a talk on the physical principals of 50 MHz propagation by K6MIO (by tape); and concluded after lunch with a talk by N6TX and W4HHK on correlating sun noise and solar activity.

The CSVHFS technical sessions, organized by W5LUU, started Friday afternoon with a microwave session. Three talks were given on the subject of "Microwaves Made Simple" by WA5VJB, WB5LUA and AF1T. It concluded with the ultimate in microwaves - Lightwave Communications by KY7B and WA7LYI.

After the hotel-hosted margarita party, a number attended a play at the Point Theater. As usual for CSVHF Conferences, a three-hour swapfest took place on Friday evening - as well as the preamplifier noise figure measurements for 50zMHz and up. At midnight the Stupid Numbskulls on Two-Twenty (two) Sideband (SNOTTS) had their traditional bash.

As a stamina test, a propagation session was called to order at 8am on Saturday morning. The talks were about using UHF TV video carriers to monitor propagation (WB5LUA), exploiting aircraft scatter (WA5VJB), a multiple power level beacon system (& demo) (N4MW), and a discussion of a possible invisible meteor shower (N6CL).

The space communications session followed with a detailed update on the AMSAT Phase 3D satellite progress by N4HY, and talk about GPS and its possible use in satellite orbit determination on Phase 3D and other ham uses by W3IWI. It is expected that a consumer-grade GPS receiver optionally reading in ham grid locator coordinates will soon be available.

The EME session took place Saturday afternoon featuring W5LUU giving an overview and K2RS reporting on his many 144 MHz EME contacts made with 150 W and a single beam. The afternoon closed with the annual discussion of the state of weak-signal VHF/UHF and the membership meeting - where CSVHFS board of directors members were elected.

The Saturday evening banquet for about 250 featured a talk by Jimmy Treybig, W6JKV, showing slides and telling tales of his 24 VHF DXpeditions to out-of-the-way places all over the world in the past 10 years. The CSVHF tradition of a prize for everybody continued. Everyone called gets to choose from the remaining prizes. N4HY was second winner and chose an 8877 tube - kilowatts on VHF. It was announced that N6CL/5 will host next year's Conference in Oklahoma City, and thus the VHF editor of CQ follows the VHF editor of QST as CSVHFS president. The 1994 Conference will be hosted by N4MW in Memphis.

After a Sunday morning breakfast meeting of the Six Meter International Radio Klub (SMIRK), the Conference was brought to a close with the second session on VHF ionospheric propagation. Bob Cooper (ZL4AAA, VP5D, K6EDX) explained his proposal for a network of "smart" 50 MHz beacons, or robot stations. This brought much discussion. WA5IYX gave results of his 30 years of nearly-full-time observation of Es openings - mostly on the 88-108 MHz FM band. W9IP presented W3EP's talk giving statistical data on transatlantic 50 MHz Es openings. A panel consisting of K6QXY, K6MYC, W6JKV, and ZL4AAA, discussed Cycle 22 50 MHz propagation. Then we all repaired to Tierra Linda Ranch for a barbeque hosted by W5OZI and W3XO/5.

As usual, perhaps 1/3 of the speakers had some sort doctorate: archeology, math, EE, physics, etc. Others included a vintner, various engineers, technicians, Fortune-500 company president, investment banker, ...

73, Bob W3OTC

1184. POLICE SCANNERS NOW LEGAL FOR KY-HAMS

In several respects I agree! I've heard some incredible things over
the years on 2 meter repeaters. I've heard deliberate jamming on 75 meter
SSB. I've seen some crooks in action at hamfests, etc. No matter what
large group of people you find in life, there are always going to be a
few bad apples. I think you're blowing it out of proportion. However,
due to the amount of knuckleheads I've found on 2 meters around here, I no longer talk on
any of the local 2 meter repeaters.

Funny, I pass dozens of cars on the shoulder of the road every day. Some of them stay there for weeks, gradually losing parts, until the State Highway Department finally hauls the stripped carcass away. I work for a news organization that specializes in blood on the highway stories. The last time we reported a collision with a parked car was three years ago when a sleeping trucker ran off the road and hit a hiding police car running a radar trap. That car was waaaaaay back in the bushes, as far as if he had been parked in a driveway. Atlanta is a busy traffic town, yet collisions with parked cars are very rare. I think you are over reacting to a situation that isn't an imminent threat to life. A car stalled in the *middle* of a traffic lane now, that's different, and requires an immediate call to 911, not some commercial towing service.

Conversely, those IN the organization whose positions you oppose will grandly ignore your opposition and point with great pride to the fact that you are still a member - "they must agree with what we're doing, or they wouldn't keep renewing."

No, I believe you can have as much or MORE influence on any dues-supported organization by making your position known AND explaining that the error of their ways is why you will not support them with your membership.

In that way, you are making doubly sure that your point is understood. You have "put your money where your mouth is."

If you break down 70 miles into the desert, there's no cellular service,
no passing vehicles for the last two days that you can flag down, and
the buzzards have started to circle, you still shouldn't call a commercial
towing service. You should call the Sheriff's Rescue Unit. It's not an
emergency unless you need emergency services personnel.

Most cell systems route you to a central dispatch center that will ask what county you are calling from and transfer your call to the correct agency. The few that don't should have the wrath of the Public Service Commission brought down on them. On BellSouth systems 911 is always a free call, even for units that are deliquent in their bills and have had their regular service disconnected.

On the other hand, dialing 911 via an autopatch will often result in emergency response units being sent to the *repeater* location. Even if you explain to the dim bulb answering the phone that you are calling from a mobile unit, they will still push the button that transfers the location information to the police or fire department. That information is the *repeater's* address. Then the repeater *trustee* starts getting $100 fines for false emergency calls and discontinues autopatch service.

I don't see any room for interpretation either. As control operator of
the station, it's your duty to *immediately* cease transmission to avoid
violating the rules. If you fail to do so, you are in willful violation
and should be fined. I'll bang the repeater down on anyone yapping away
in their mobiles with the entertainment radio blaring in the background.
If you must operate in a high noise environment, like a parade, where
music is likely to be transmitted, you should use a close talking noise
cancelling microphone to avoid pickup. If you can't do that, you're not
using good engineering practice and shouldn't be transmitting.

So does this mean they made the Technician test even easier?
Wow. I assume "Tech Plus" - something the FCC do not seem to have in
their database - means Tech with Morris.

BROADCAST BAND APPARENT FREQUENCY DEVIATIONS AND EARTHQUAKE FORECAST-ING - A 15 MONTH REPORT

WINTER 1990\COMMUNICATIONS ELECTRONICS JOURNAL 191

ANARC NEWSLETTER, August\September 1989

by Raymond F. Cole
1918 N. Kings Highway, Cap Girardeau, MO, 63701, USA
(314) 335-1496

[Copyright 1988 by Michael G. Knitter, National Radio Club, Inc. The following article was originally published in the 11 April 1988 issue of DX News. It was voted "Article of the Year" by the ANARC Club Representatives.]

The possibly devastating damage by earthquakes has grown greatly due to increased populated density and city growth and complexity. For several decades scientists have sought a reliable means of fore-casting quakes, and in a few successful cases in China in recent years, when whole cities were ordered evacuated, thousands of lives have been saved when it was possible to give an advance warning. No way has yet been found which meets all the criteria of a successful forecast, i.e., reliability, timing and severity. Now an entirely new possible means has been accidentally discovered and carefully followed up for fifteen months. Many questions remain to be answered, but many more have been satisfactorily answered.
During this investigation there has been considerable normal skepticism by some of "the establishment" in seismological and radio fields, but in a few cases, an open mindedness and cooperation that included very valuable suggestions. A university professor, well known for his own scientific investigations in another field, played "the devil's advocate" with questions and criticisms concerning methods. Much is owed to this "devil's advocate."
Skepticism of friends and acquaintances vanished and became interested support when two California quakes were successfully pre-dicted within a twenty four hour time period, a week in advance. However, a subsequent third similar prediction passed with no result--

possibly because the San Andreas Fault was locked too tightly for the amount of force applied.

The phenomena that was accidentally discovered in December, 1986, was that within the 550 to 1600 kilohertz broadcast band there were apparent shifts of frequencies, occasionally as much as 15 kHz on a superhet radio, even though the transmitters are allowed a tolerance of only .05 khz by the FCC and even though most modern transmitters automatically shut down with a deviation of .5 khz.

The very first indication of this phenomena appeared when trying to accurately log distant stations with a new crystal set called the Tuggle Circuit. For a crystal set it has remarkable sensitivity and selectivity and quickly logged stations spread over half the country, plus Canada, Mexico and the Netherlands Antilles.

However, a non-powered crystal set does not have stabilizing oscillator, mixer and intermediate frequency circuits, and the apparent frequency deviations were quite "wild"--up to 40 khz. A frustrating situation.

At this point a portable superhet with a RF stage, a Radio Shack TRF 12-656, became the chief means of monitoring the phenomena. It had a section of a centimeter ruler already installed in the dial as a means for accurate logging, the circuit had been peaked, and the logging scale was calibrated with a crystal oscillator. Later a nine point vernier scale was added to the dial pointer and a multivibrator circuit added to the oscillator for a recheck of calibrations.

Periodically, various theories and results of this investigation were published in the DX News by the National Radio Club, which prompted some helpful suggestions and contributions by a few of the many club members.

Beginning in December, 1986, both air and ground moisture and precipitation were ruled out as possible causes. Variations in the radio itself were ruled out through use of a second radio, a GE portable, which showed identical results as far as could be determined with its similar, but not quite as easily readable, logging scale. Outdoor and radio shack temperatures were also ruled out, and so was the use or non-use of an external antenna, and either AC or battery operation.

Right after Christmas the author "stuck his neck out" to eight persons, one a radio amateur, another a lifelong radio repairman and amateur, and the others close acquaintances. The theory that I advanced was that earthquake fault stress had to be the cause of the phenomena. Naturally it met with great skepticism--and perhaps some doubts about my sanity. On December 29th all that changed due to a 3.5 tremor centered 60 to 70 miles south of the New Madrid Fault. No deviations could be found remaining on December 30th. However, on December 31st much lessor ones began to appear again. So investigation of this phenomena began in earnest, although in a rather fumbling "gallop off in all directions at once" sort of way--since nothing whatever was known on anything like this.

One promising avenue of investigation was suggested by a member of the National Radio Club, electrical ground currents. So a 365 foot

wire and ground rod was installed and careful measurements periodically taken. The results were negative, but helped later in disproving a theory developed at MIT which was at first considered in the probable cause.

Even moon and tide cycles were studied. A very sophisticated magnetometer was borrowed, installed and studied for over a month. Eventually an attempt was made to use the radio receiver's tuning knob shaft to drive a one-meter-long dial's pointer to try to get accurate tenth of a kilohertz readings. The latter failed due to dial cable stretch, even when a guitar string was used.

A magnetic compass about 40 inches long was made with a piece of three-eights inch iron pipe and a very strong speaker magnet. It was suspended from the ceiling and completely closely shielded from drafts. Contacts and contact strips recorded both vertical and horizontal deviations on a double track millivolt recorder. It did record as high as a 4 degree horizontal deviation and a 1.5 degree vertical deviation while in use. These at times seemed to correlate with frequency deviations. However, after about three months it was discarded as being more confusing than useful, even though extremely interesting.

Monitoring and recording of apparent frequency deviations on a continual, several times a day, basis yielded some very interesting results. Foremost was the fact that different frequencies were being affected in different ways (i.e., some drifting higher and some drifting lower in frequency--and some doing some of both) and in differing amounts.

This was overly illustrated in a one-time-only occurrence with the "overacting" crystal set when two stations 20 kHz apart were tunable, and while being tuned, the one to the left on the dial "flipped" across to the right on the one that had been on the right-which stayed where it had been! Most deviations certainly do not occur so quickly, but since no means has yet been found for constant monitoring and recording, the median time of change is not known. Many have been found to occur within one hour, and several times deviations have occurred which actually trying to tune a signal.

A second result is that there seems to be no one ideal average frequency for monitoring, although some frequencies are far less affected than others. It was hoped that a single one could be found that would be typical of all, and that all effort could then be concentrated there. Averages of a dozen frequencies were figured and it was found that three of four would normally run closest to that average, but there were striking exceptions which obviously cannot be ignored.

A third result is that it was found that frequencies below 550 khz do not show observable deviations. It was suggested by a radio engineer who installs broadcast transmitters that deviations should seem greater at the lower frequencies. It is probable that the much lower power used (usually 20 to 100 watts) on those frequencies account for this.

Four tremors of 3.0 to 3.5 southward 60 to 90 miles on the New

Madrid Fault, and one about 150 miles eastward on the Walbash Fault, beginning on December 29th through August, 1987 provided considerable opportunity to observe a cause and effect relationship between frequency deviations and quakes. And many, many times deviations would gradually increase and then subside with no apparent effects. However, any tremor below 3.0 is neither noticed nor newsworthy, so some lessor ones may possibly have occurred. But more on this up and then down effect later in this report.

In one instance when both frequency and magnetic compass deviations were being recorded, a severe quake in Chile resulted in an immediate drop here in both deviations. It seemed that the shock wave released local stress. Timing on this was checked locally at the seismograph at Southeastern Missouri University. This seismograph is not usually readily accessible to correlate data due to my own working hours and to necessary University security concerns. Lengthy and retailed reports on every tremor registered by all seismographs are available from the government--I have one on hand--but are six months to a year behind, and absolutely useless for current correlation.

An interesting experiment was to take the GE portable radio thirty miles and check deviations for a comparison with deviations at the usual monitoring point. (The Radio Shack TRF 12-656 is glued in place as a precaution, although movement or rotation of it has not been found to cause deviations). Results were a surprise--approximately the same. However, two months later a map of small local faults was found [*] and it was discovered that the largest local one runs out west an undetermined distance! And probably approximately under the highway taken out west!

Another interesting experiment was to hold a very strong magnet close to the receiver at various points around it to see if deviations could be caused. At some locations signals were virtually nulled out completely, but no deviations of any kind or size could be caused

Loggings taken on the GE portable and the Radio Shack TRF 12-656 at the same time, while together and on the phone and four miles apart, were often in agreement and often in disagreement, but most of the time both showed deviations on the same frequencies--although sometimes on one frequency one would show a deviation and the other would not. However, with both radios at the same location both would show almost identical deviations.

Early in May, 1987, in a purely chance meeting with the owner-manager of one of the local stations that had shown deviations prior to the December tremor, I explained to him the phenomena that I had discovered. He then told me that an FCC mobile crew had been in town in December and had contacted him saying that his station was "way off of frequency". The owner checked and it wasn't, so he did nothing. A follow-up FCC check and written report (not from a mobile crew in town--and still his files when I spoke to him) stated that the station was on frequency. Evidently the local crew with a local receiver was getting apparent frequency deviations, too, with presumably state of the art equipment.

In efforts to develop a means of automatic monitoring which could

be recorded on a available double track millivolt chart recorder--but with very limited funds and electronic skills--several approaches were tried. First were various frequency-to-voltage circuits. Most worked well only on square wave inputs and could not be adapted within my range of skill. Others required too high an input level. None produced a steady, level output suitable for driving a meter.

Second, a pair of oscillators was tried, one tuned slightly off on each side of a local signal. When a frequency deviation occurred, and they would after varying periods of time--sometimes days, it was instantly and plainly audible. But again was not adaptable in any known way to drive a meter and I could not be there twenty four hours a day to make a record.

Third, and best, was balancing the output of two identical radios tuned slightly to each side of a signals through a center trapped transformer, and driving a single meter. with the volume controls and tuning properly and carefully adjusted, the result was virtually no output signal. With a deviation this was thrown out of balance and the meter would fluctuate wildly along with the modulation--which made a line recording impossible. I addition, with the radios imbalance and the signal nulled, "untunable" (and therefore "un-nullable" lightning static from a hundred miles away made the meter unstable.

Early in the investigation of this phenomena it was thought that the dilatancy theory discovered at MIT some years ago was the probable cause. This involves the microscopic fracturing of rock under pressure, the filling of these cracks with water, and thus higher electrical conductivity of the rock. The 365 foot wore and ground rod investigated this possibility.

However, a theory advanced by the radio engineer, previously mentioned, who installs transmitter, seems much more likely to be the actual cause. His theory is that quartz under pressure vibrates electrically and can then transmit radio waves.

Quartz crystals are a very common use in the radio field and in many other fields. Quartz ignites on stoves, furnaces, bar-b-ques and other gas appliances are a good example. When the quartz is struck a light blow, it emits a strong spark. The engineer theorized that radio frequency signals emitted by quartz are mixing with man-made radio frequency signals and the resulting mix, as in a receiver's mixing circuit, is the apparent deviation received. In such case, different stratas or "lumps" of quartz are emitting different frequencies--due to differences in size and in pressure at different locations--which is why one frequency has different deviation from another.

Quartz is extremely abundant in Southwest Missouri, but is also usually plentiful in most places. There have been occasional complaints by Dxers about the inaccuracies of digital readout receivers. In my opinion the engineers will never to cure this problem because the cause is not within the receiver in all probability. If the apparent deviations vary from time to time and from frequency to frequency, and sometimes do not exist, it most probably is not the receiver.

Almost all radios built today with standard dials cannot in any way be useful for accurate logging of any kind without modification of the dial--which usually is not too difficult to do. Most people using AM radios simply readjust the dial if it seems off frequency. Locally, some owners of clock radios set to an AM station have said that occasionally the dial has to be readjusted for no known reason. After fifteen months of observations, record keeping, and experimenting, there seem to be several very definite conclusions and two probable theories. One theory may seem pretty far fetched, but so did this whole subject of apparent tuning frequency deviations to begin with--as I said, I think some had some doubts about my sanity for a very short while!

CONCLUSIONS

CONCLUSION ONE - Apparent tuning frequency deviations on the AM broadcast band are a well-proven and now well-documented fact, and in this area at least, are almost always existent on one or two of about twelve most usually monitored frequencies, are frequent on many, and usually range between one and three kilohertz--most often up-frequency. Prior to a tremor, 10 khz is frequent.

CONCLUSION TWO - Similar deviations, though not as great, can be found in areas not located on or near known active fault areas, provided one is looking for them with an accurate dial and keeps a record of previous log readings.

CONCLUSION THREE- they often increase to lesser degrees than found before a tremor locally, and then decrease, usually suddenly.

CONCLUSION FOUR - They increase very markedly before all local tremors and decrease or vanish immediately after such a tremor.

CONCLUSION FIVE - Sometimes following an increase and decrease without a local tremor ensuing, in about 1.4 days a tremor can occur, as one did, in Oklahoma (very rare there)--or in 6.36 days can occur in California or on the west continental coastline, as four have.

THEORIES

THEORY ONE - Pressure on rock and the quartz deposits in the rock generate a signal mixing with broadcast band radio frequency signals forming a mix which is received as an apparent tuning deviation.

THEORY TWO - The well-known westward drift of the North American continent is widely assumed to be caused by a very slow flow of the soft, pliable plastic-like upper mantle beneath the crust, upward in the Atlantic Ocean area, then westward, and then downward in the Pacific Ocean area. This material sometimes breaks through as volcanic lava. The earth's crust is probably rough on the bottom just as it is on the top. Harder, denser portions of the mantle, moving westward in relation to the crust, push against "bumps" and rough spots on the bottom of the crust and cause the westward movements of

the continent. If the very upper portion of the mantle is more toward a semi-liquid state than usually assumed and there is more of an actual flowing of this material, then the denser portions pushing against crust rough spots could create pressure moving from one spot to another westward.
"Traveling pressure waves" thus created explain frequency deviations in lessor amounts found where no known active faults are known to exist--simply due to minor pressures. This seems very solidly supported by the loggings, for example, of frequency minor deviations (during a quiet period in Southeast Missouri) in southeastern Wisconsin, an area not known for faults or tremors. This was done, in this case, by a former chemistry instructor, now an industrial chemist, with a Kenwood R-2000 digital readout receiver.
"Traveling pressure waves" evidently push against a bottom-of-the-crust "bump" here at the New Madrid Fault, sometimes cause a tremor, and then move on westward in relation to the crust. The top-of-the-surface speed calculated to approximately twelve miles per hour. Therefore stress indicated in Southeast Missouri arrives on the West Coast in about 6.36 days. This makes it sometimes possible, even with very rudimentary equipment, to predict quake risk for California from Missouri, and the approximate timing, but not the severity. Local AM radio monitoring in California could probably indicate the latter with a day or two additional last minute warning.
To develop this phenomena and discovery into a useful and viable quake risk forecasting and warning service there are several needs.

NEEDS

NEED ONE - A means of automatically monitoring and recording deviations on a twenty-four hour basis.

NEED TWO - A network of monitoring points across the country and several stations in known fault areas.

NEED THREE - A virtually instant means of transmission of data from all monitoring stations to a central correlating point.
Individually speaking, radio enthusiasts, particularly Dxers, living on or near known quake-prone areas need to know of this phenomena and modify and accurately calibrate a logging dial so that they can easily become aware of ongoing deviations that may warn of a direct threat to themselves. With an accurate dial and a little record keeping, they will soon come to know which deviations ar permissible without constituting a danger, and which should be taken seriously and carefully monitored.

A NEW book (due out the third week of August, 1992, is at the printer AND IS titled:

"SUCCESSFUL QUAKE RISK PREDICTION - a do it your self manual" :-)
the smiley is mine!
DAJJA Enterprises (608) 423-4159
Michael G. Knitter

P. O. Box 24
Cambridge, Wisc. 53523-0024

This 50-60 page 8 1/2 x 11 soft bound book will cost approximately $9 (plus/minus $5). Both the author and publisher state that some degree of seismic or RF knowledge is necessary to grasp the contents of the book. In other words, the reader should have basic knowledge of earthquake mechanisms and RF radio propagation. Your mileage may vary.

Message-ID: <309@arrl.org>
Source record: 286564

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email may be sent to the ARRL/VEC at:

bjahnke@arrl.org

or

MCI MAIL ID: 215-5052

You should include your postal address (the slow kind) in case we need to send you non-electronic material in answer to your question.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you will be attending the test session.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

>73 de wb8evi

Well, I guess Pat hit my hot-button. Pat is not a ham, and I'm still a little confused as to how he can make sweeping (supposedly informed) analyses of our hobby and how the "CB'ers" have ruined it. I've passed along a fairly level-headed reply to the newsgroup and hope he will publish it. Pat has historically engaged in non-specific and ad-hominem attacks against groups and individuals, and when those individuals pick apart his reasoning, he moves on to another subject, forgetting that he's just put his foot in his mouth. (This is in stark contrast to the general high quality of the newsgroup, which is why I was reading it on the days he made this, and other, unwarranted attacks).

I'm sorry your current experiences on amateur radio are so disappointing, Mike, but it does beg the following question. What are you doing in your community to bring up model hams and set good examples on the air, driving out the bad operators? Shutting off your radio will remove the bad operating practices from your mind, but not from the air. Silent resignation to the way things are on the ham bands will not make our hobby any better, only much worse, and will leave ourselves open to criticisms like those given by the comp.dcom.telecom moderator.

Well, Mike, I can certainly sympathise. But should we abandon our frequencies to the "knuckleheads" or take them back? I'm reminded of a quote -- something along the lines of:

"The only thing necessary for the triumph of evil
is for good men [people] to do nothing."

It's our choice.

That assumes that you have lots of room to get off the road. Also, walking along a freeway is not my idea of safe. Of course, I have been in the Detroit area for about 3 years now, so I hear eneough about people getting killed in the most creative ways on the freeway.

1199. Morris Watch

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-26 15:32:10 UTC
From: julian@bongo.UUCP
Message-ID: <550@bongo.UUCP>
Source record: 286803

The July 18th-24th 1992 edition of the Economist (U.S. Edition) has a special section on "The Legal Proffesion". The World's second oldest according to John Mortimer (who dat?).

On Page 9 of the supplement is an ad from Arthur Andersen. They are touting their services as expert witneses and and "strategic consultants". The slant of the article is that they will cut through the jargon and code.

Two thirds of the page is covered with printed Morris. What does the Morris say? Two words - yes, I know two words in 2/3 of a page - the words are: Gobbledgook and Nonsense. Are Arthur Andersen trying to tell us something?

>You have "put your money where your mouth is."

I disagree with Brian on this point. I would not say I am a
"joiner" or in any way gregarious, but I belong to the ARRL. I belong
to no professional organisations. I will not join any fraternal or
secret societies.

But I belong to the ARRL because as a member I feel I am in a
better position to ginger and harry them. The ARRL purport to represent
the interests and aims of amateur radio to national and international
bodies. If they are going to assume this task, I want to be able to let
them know what I think.

Yes, I know they may ignore me and want me to go away. They
could always tell me they don't want me as a member if I get too
tiresome. They haven't done that yet, other organisations have. o

So I spend my money, with an organistaion that claims to
provide services. I then get to thump the counter when service is
sloppy or slow. As a customer I have that right. As a non customer, I
would not be in a position to demand better or different service.

Some of you may be aware that AO-13 is not operating normally. Here is the latest info as copied from the telemetry. As of today (7/26) at 1800z, the satellite was still not back in full service.
--
L G3RUH/DB2OS/VK5AGR *** Future AO-13 Transponder Schedule ***
Mode-B : MA 0 to MA 40 ! from 1992 Aug 17 - Sep 21
Mode-S : MA 40 to MA 50 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 50 to MA 55 !<- S beacon + L transponder
Mode-JL : MA 55 to MA 70 ! This schedule operates
Mode-B : MA 70 to MA 256 ! every orbit, every day.
Omnis : MA 160 to MA 10 ! Alon/Alat 150/0
Please DON'T uplink to mode-B MA 40-50; interferes with mode S

M QST de G3RUH 1992 Jul 20. The re-orientation from Alon/Alat 210/0 to 150/0 commenced on perigee 3133/4 and will continue for a total of 16 perigees, finishing July 25. The interim attitudes at 2 day intervals are planned as 192/9, 177/11, 161/7 and 150/0 with the Sun angle remaining at 45 degrees throughout. Magne-torquing is not an exact science, and departures from the above are possible. We have NEVER operated the transponder at this Sun angle before, so the spacecraft is not yet calibrated >N

N for these conditions. Though the re-orientation is proceeding as planned, the combination of a Sun angle of 45 deg (ill = 71%) transponder, magnetorquing and eclipses (illumination =0) is proving too much for the battery causing the software low battery voltage monitor to shut down transponder automadically. This happened, approx Jul 19 [Sun] @ 2315 utc. So, until magne-torquing is complete, planned as July 25([Sat], the mode-B transponder is ON from MA 35 - MA 95 only. 73 James

Yes, that was the call, and yes, those were the days :-). OTOH,
14.313 kinda makes W2OY seem tame by comparison, don't you think?

Message-ID: <1992Jul26.204755.8119@rock.concert.net>
Source record: 286784

I am having trouble getting info from Toyota about installing
146 Mhz and 440 Mhz rigs in a 92 Camry. All they say is "don't
do it". The owners manual states at the front of the book to not
install two-way radios and it repeats the statement in the section
on air bags. Certainly, I don't want to key the rig and have the
air bag deploy...:-)

So, I'd like to hear from anyone who has a rig in a 92 Toyota Camry.
What would be helpful is type of rig, where mounted, power used,
location of antenna, routing of coax, and type of antenna.

Certainly, with proper installation it can be done in a way that
doesn't interfere with auto computers, air bags, etc.

Thanks.

Source record: 286786

I have in front of me, a ZyXEL U-1496S modem. This is the sort of state-of-the-art-modem I would have had my group design were I still working in modem research at Gandalf Data.

It has a 2 line by 20 character LCD display, menu-tree programming from the screen via 4 pushbuttons, and implements a whole bunch of CCITT protocols up to 14,400 v.32bis/v.42.bis, and v.17 FAX. Needless to say, it does both sync and async, and even has modes for use with cellular and satellite.

(Presently, the operation modes are: v.33; v.32bis; v.32; v.29; v.27ter; v.22bis; v.22; BELL 212A; G3 FAX according to T30, v.17, v.29 and v.27ter; and most variants.)

What does the display do besides allow you to program all the registers? Well, you can not only see the incoming connect speed, but also things like:
- Signal-to-noise ratio
- Received Carrier Power Level
- Phase Jitter (p-p degrees with .1 deg resolution)
- Frequency offset between TX and RX freqs (in .1 Hz res)
- Round-trip echo delay in (1/2400 sec)

...and a whole lot more.

After your communication session has finished, you can even call up (by an AT-command) a "Link Status Report" which will give you:

- Chars sent; Chars rcvd; Octets sent; Octets Rcvd
- Blocks sent; Blocks rcvd; Blocks re-sent;
- Max Outstanding; Max Block Size;
- Retrain requests; Retrains granted; Link duration;
- T401 timeouts; T402 Timeouts; FCS Errors;
- Round-trip delay; Xmtr under-run; Rcvr Over-run
- Reason for disconnect.

With the latest ROM revisions, it handles Caller ID, 4 different ringing codes, and the maximum speed is 16,800 baud. (They are working, I believe on 19,200 baud.)

Finally, for the technically minded, it can even be supplied with X- and Y-axis outputs for a scope, so that you can see "eye" or "constellation" diagrams.

There are three telephone receptacles for telco line connexions: One for a local phone; one for 2/4-wire leased-line, and one for 2-wire dial-up line. (The dial-up line even supports telco 1A-key system A-

leads for lamp status control.)

Lots of features have been left out of this little blurb to try to keep it as short as I can.

Upgrades? Well, they are via a couple of 27C010-15 (1Mb) ROMs, and the binaries are usually posted on their BBS, or available via FTP or mail-server from various sources (including here). So, if you have access to a ROM-burner, you can do the upgrades yourself.

Just had to let you know about this great little modem, in case you hadn't already heard.

Anyhow, having said all of that, you can get most info (including TIFF-image files at 300dpi) from my mail-server. To save space, the files have been compressed with ZOO, which is available for most O/S from DOS to UNIX. (ZOO version 2.10 for DOS and for UNIX is available via mail-server request from this site.)

To get started with the mail-server, send e-mail to:

mail-server@questor.wimsey.bc.ca

and in the body of the text, enter the following at the left margin, with nothing else in the body:

```
HELP
INFO

1206. Re: Is it "business" if I use and autopatch to...

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-26 22:35:53 UTC
From: ron@pilot.njin.net
Message-ID: <Jul.26.18.35.52.1992.21289@pilot.njin.net>
Source record: 286787

> I think you are over reacting to a situation that isn't an imminent
> threat to life.

I spent a little over three years in a volunteer fire department (Cowenton Volunteer Fire Company, White Marsh, MD). We had responsibility for running on I-95 from approximately the Baltimore Beltway up to the county line. In that time I saw the following fatal accidents (and there were likely to be more that were responded to when I wasn't around):

1. Car stops for some relatively minor problem (flat or something). Wheel comes off Semitrailer and bounces down the shoulder eventually hitting and killing the car driver (Yes, I know this one is bizarre).

2. Tractor-trailer stops on shoulder (nice wide I-95 paved shoulder and the truck is well over in it not encroaching on the left lane. Another truck (straight van, not tractor-trailor) slams into the rear such that the right half front of the striking truck hits the back corner of the trailer driving it and the front seat passenger five or six feet backwards. Both driver and passenger killed. In the backup that this created a careens off the road striking tree (driver alive, but seriously injured), then three trucks carrying lumber get involved further back in the backup and the middle one catches fire, flambee'ing the driver (fatality 3).

3. Bakery delivery truck strikes car on shoulder and driver. Driver is driven so far into the undercarriage of the truck that it is not removed in one piece.

4. A church group stops (bladder break?) on the side of the road. Another car slams into the rear of the parked car. A small child in the back seat his hidden by the wreckage and is not even missed until after all the other injuries are transported. She dies.

These are fatalities directly related to someone being stopped on the side of the road and either being struck by or striking the stopped vehicle. I've seen two other fatalities that involve a backup caused by people slowing down to look at cars on the shoulder. One was an n-way truck slams into a car driving several others into another flipping one camaro over in the process. The driver immediately in front of the truck is killed, as the truck ends up on top of his car. We had initially though it was a volkswagen from the wreckage, it turns out it's a pickup truck. In another a car careens off the road when it realizes traffic is near stopped ahead and heads into a tree. Driver is medeveced but dies anyhow.

In each case there is no indication that these accidents involve any alchohol (fatigue, highway hypnosis, maybe), in stark contrast to nearly every other motor vehicle fatality I've dealt with. In those cases either the victim or the other driver had been drinking.

Since I've moved and have been down here in Va, I've read in the paper (the Washington Post, not the McPaper) about two other similar accidents.

-Ron

1207. J-38's, AM, CW, Religion, and Courtesy

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-26 22:40:10 UTC
From: jseboldt@pnet51.orb.mn.org
Message-ID: <8141@orbit.cts.com>
Source record: 286610

At last, I'm able to post here...

"But I just had to look,
Having read the book,...."

--- Beatles, "A Day in the Life"

>Much of the recent discussion about J-38 keys (and any of the other
>thinly disguised forms of the ever-recurrent CW debate) seems to
>ignore the central reality of just what CW is and its true though
>unstated role in Amateur Radio. It is my contention that the key (pun
>intended) to understanding the importance of the J-38 to some hams is
>to see it as a traditional religious implement and morse code as the
>central sacrament of a religion.

Fascinating. As a fundamentally religious man, even "having read the
book" by Jaynes, I would agree wholeheartedly.

>Please note that in making my observations I am not making "good vs.
>bad" value judgements but rather studying the phenomena of CW within a
>psychological/phenomenological/religious/anthropological context that
>may explain the devotion that some hams feel towards it as well as
>some of the antagonism felt by others. It is my observation that CW's
>appeal is best understood in the context of religious phenomena and
>questions as to its technical appropriateness are beside the point.

TouchE! On the practicality level, a common analogy often used is that
CW (or AM, or RTTY, or other less-than-perfectly-state-of-the-art modes)
is akin to sailing -- not necessary for routine transportation, but for
the "thrill of it all", the wind in your sails, the bleeps in your ears
from the other side of the world at night on 30 meters with 50 watts and
wire antennas.

Speaking to the religion analogy, one might hope for the same tolerance
for one another's ham preferences as our nation's founding fathers hoped
for regarding religion in society.

1209. Ten Tec Argosy

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-26 22:40:12 UTC
From: jseboldt@pnet51.orb.mn.org
Message-ID: <8143@orbit.cts.com>
Source record: 286608

I am a regular user of a Ten-Tec Argosy, model 525 -- my only rig on HF. I'm almost certain it is also available in a model with a digital readout, though mine is analog only. This is a descendant of those Triton IV's, running 50 watts (switchable to 5 watts with a back panel switch), runs 80, 40, 30, 20, 15, and 10 meters. It's an all-solid-state analog rig with QSK, audio notch, RIT standard... optional audio filter, CW crystal filter, noise blanker, calibrator. It has been a very good little rig that's easy to modify, work on, etc. I use it on AMTOR (AFSK) very nicely.

Only major problem is an elusive mechanical stability problem in certain parts of the dial -- only a problem with AMTOR, really. I just ran it on a camping trip to Canada, full 50 watts off a 10 amp hour sealed battery from my tent. 2 years ago, worked lotsa 20 meter DX late at night with it from a campsite, too! They sell for about $400 -- if you ever see one (my guess is everybody hangs on to them, they're so nice!).

I love it. Kind of akin to sailing -- gets you there with a certain charm, keeps you in contact with the basics.

Anybody else have some thoughts on this rig? Modifications? Retrofitting the digital readout?

Simple? Try the Ten Tec Argosy -- if you can find one. That's my only rig. You can get one with a digital readout -- not as accurate as a TS950, but decent. You can actually work on the thing. Mine is a "camper" rig as well as a home rig -- kind of a beater.

I will second the character of 30 meters for CW. I like high speed as much as any moderately old-timer, but everything I read in the books and learned from my Elmers 23 years ago says you should slow down to what you hear!

Even as a CW man, I will also second the motion about AMTOR. More ragchewers per kHz than any other mode I know of! Even the DX, if you get it.

1212. Re: Comp.dcom.telecom Moderator attacks ham radio

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-26 23:02:14 UTC
From: ron@pilot.njin.net
Message-ID: <Jul.26.19.02.14.1992.21538@pilot.njin.net>
Source record: 286788
Cross-posted to: rec.radio.amateur.misc,rec.radio.cb

The thing that's been bothering me is the "holier than thou" upholders of true hamdom who insist on interfering with other hams.

Incident #1: Field Day 92, I'm in the process of working some VI station that is calling CQ field day on 20 meters. During this someone keeps talking over this guy without identifying to tell me that he was caught cheating on some previous ARRL contest and is disqualified from competition. Great, we've got some guy that perhaps is no longer in good standing with the league, but hasn't broken any regulations, but we have this dunderhead who is breaking the rules by intentionally interfering with other stations and not id'ing (a good thing when you're breaking one of the big rules, I guess). Jeez, look, if the guy is really dq'd from contest competition and the league removes him from my logs, big deal, two points and maybe 30 seconds lost while I work him. Not something that really justifies this sort of thing.

Incident #2: Repeater uses brand-X repeater controller so everyone knows how to knock down the autpatch. Another unidentified user decides something he hears is not appropriate for the amateur service and knocks down the patch. He is not the (a) control operator of the repeater (would have explained his actions to the guy he interupted had he been). Great, again unidentified intentional interference with another user. The transgression of improper patch usage may or may not have been real (see recent discussions here about what is music and business communications). Also, this clod is not the trustee of the repeater or one of it's designated operators, so he's got no business messing with the control functions.

Incident #3: Field Day 92, a health and welfare net is trying to coming up on 20 meters for the earthquake in CA. 1 KHz up someone is calling CQ Field Day, I call him and suggest maybe we should move up a few because of the net, but that only gets me "2A North Texas, QRZ...

I doubt any of this has anything to do with the influx of CB'ers or anything else into our hobby. These eggs have been ticketed since before incentive licensing :-)...

Antilitigation smoke screen. Any car that is that succeptible to
RF is going to be a hazard anyhow. What happens when the car
next to you keys his transmitter. Also, someday people will
wake up and realize that mobile telephones are radios...

-Ron

The privacy of a phone with the convenience of a radio (or is it the
other way around?).

Subject: New Radio Shack Scanner
Newsgroups: rec.radio.amateur.misc
Nf-From: trsvax.tandy.com!rpo Jul 16 10:25:00 1992

*NEW ITEM ANNOUNCEMENT
*
*Radio Shack announces the PRO-43, 200-Channel Portable Scanner
*with HyperScan. This is the first-ever Realistic handheld scanner
*that features a triple-conversion superheterodyne circuit that
*eliminates cellular image problems on 800 MHz, and also improves
*image rejection across the entire reception band.

The triple conversion is a welcome feature. I have a Uniden BC200XLT, and
the image problem is rediculous. Memory is cheap, how about more channels?

*The scanner also features:
*
*|-| Access to over 48,000 frequencies including 200-400 MHz
* military aircraft and 800-MHz public safety bands

It is nice to add the 200-400 MHz "bands".

*|-| Automatic and manual AM/FM mode selection

Nice.

*|-| Monitor bank |-| Memory saver |-| Priority channel

How about a "VFO" mode like the ham radios where you can tune in a frequency
without storing it in a memory.

*Coverage: 30 - 50 MHz (in 5 kHz steps)
* 118 - 136.975 MHz (in 25 kHz steps)
* 137 - 174 MHz (in 5 kHz steps)
* 220 - 225 MHz (in 5 kHz steps)
* 225.0125 - 400 MHz (in 12.5 kHz steps)
* 400.0125 - 512 MHz (in 12.5 kHz steps)
* 806 - 823.9375 Mhz (in 12.5 kHz steps)
* 851 - 868.9375 MHz (in 12.5 kHz steps)
* 896 - 999.9875 MHz (in 12.5 kHz steps)

How about the Ham 6m band 50-54MHz?
How hard is it to defeat the cellular phone frequency lockout?

*FM Sensitivity (20 dB S/N at 3 kHz deviation): 1 uV
*AM Sensitivity (20 dB S/N at 60% modulation): 2 uV

Sensitivity could be much better. I can always add an attenuator for intermod problems if I am downtown. It is much easier to add an attenuator than a preamp.

*Spurious Response Rejection (at 328 MHz FM except primary image): 40 dB
*Selectivity: +/- 10 kHz: -6 dB
* +/- 20 kHz: -50 dB
*IF Frequencies 1st: 608.005 - 611.2 MHz
* 2nd: 48.5 MHz
* 3rd: 455 kHz
*Audio Power: 250 mW

This is pathetic. How about 2 watts audio output?

*Dimensions: 5 3/4 x 2 3/4 x 1 5/8 Inches
*Weight: About 8.8 oz without antenna or batteries

Other stuff:

I want an S meter!!!!!
I'm not looking for the shortwave stuff (below 30 MHz). That would be useless without SSB, and that wouldn't be cheap. I don't need TV channels either.

Hey, guys, I hate to be a drag, but we've got a great little group
called rec.radio.amateur.policy were people who love to argue over
the fine points of amateur radio regulations hang out. Let's move
the discussion there.

Propagation Forecast Bulletin 30 ARLP030
>From Tad Cook, KT7H, Seattle, WA
July 25, 1992
Relayed by KB8NW/OBS & BARF-80 BBS
To All Radio Amateurs

SB PROP ARL ARLP030
ARLP030 Propagation de KT7H

The solar flux dropped about 50 points this past week. This is a
return to the suddenly lower levels that we have observed over the
past few months. Activity dropped so fast recently that many
observers expect a rise in average levels of solar activity,
probably peaking around September with solar flux around 160. This
is because the drop was sp sudden that it doesn't track with models
based upon past solar cycles.

This rise should be only temporary, as Solar Cycle 22, now in its
70th month, continues its decline. A year from now the projected
flux should be about 126, and at the same time in 1994, about 106,
followed by 83 a year after that, and reaching a minimun aroud 75
in early 1997. This would place the next solar cycle peak around or
just after the turn of the century.

As this was being written on Thursday night, the solar flux has
dropped below 100 and geomagnetic conditions are unsettled. The
stormiest days this week were the 16th and 22nd, with disturbances
from flares and coronal holes. In the next month there is a chance
of more disturbances around August 9 based upon activity in the
last solar rotation. Around that date the solar flux should peak
for the month near 170.

Sunspot numbers from July 16 through 22 were 195, 192, 161, 132,
110, 84 and 90, with a mean of 137.7. 10.7 CM solar flux for the
same period was 156.6, 135.9, 126.1, 118.5, 123.5, 108 and 104, with
a mean of 124.7.

JULY 23, 1992
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SB QST ARL ARLB069
ARLB069 NOVICE CHANGES PROPOSED

THE FCC HAS ISSUED A NOTICE OF PROPOSED RULE MAKING IN PR DOCKET
92-154 THAT WOULD REQUIRE NOVICE CLASS LICENSE EXAMINATIONS TO BE
ADMINISTERED BY THE VOLUNTEER EXAMINER PROGRAM, WHICH NOW
ADMINISTERS ALL OTHER LICENSE CLASS EXAMINATIONS. THE PLAN IS
ESSENTIALLY AS PROPOSED BY THE ARRL AND W5YI VOLUNTEER EXAMINER
COORDINATORS AND DESCRIBED IN APRIL 1992 QST, PAGE 63.

THE FCC'S NPRM NOTES THAT THE CODELESS TECHNICIAN CLASS IS NOW THE
ENTRY-LEVEL LICENSE OF CHOICE OVER THE NOVICE CLASS, THAT THE FCC IS
BURDENED BY AN APPLICATION ERROR RATE OF 9.4 PERCENT FOR NOVICES AS
COMPARED TO ONLY 0.8 PERCENT FOR VE-ADMINISTERED EXAMINATIONS, AND
THAT NO PASS-VERSUS-FAIL RECORDS ARE AVAILABLE FROM NOVICE
EXAMINATIONS, AS THEY ARE FOR VE-ADMINISTERED EXAMS.

THE FCC BELIEVES BRINGING NOVICE EXAMS UNDER THE VEC SYSTEM WOULD BE
IN THE PUBLIC INTEREST, SAYING THE VEC SYSTEM ''HAS DEMONSTRATED
BOTH ITS EFFICIENCY AND ITS INTEGRITY. WE CONCLUDE THAT NOVICE CLASS
AMATEUR OPERATOR EXAMINATIONS WOULD BENEFIT FROM THOSE SAME TWO
VIRTUES.''

OPPOSITION TO THIS PLAN HAS BEEN PRIMARILY A CONCERN THAT NOVICE
EXAMS WOULD NOT BE AS READILY AVAILABLE, ESPECIALLY IN SPARSELY
POPULATED AREAS OF THE COUNTRY. THE LEAGUE'S RESPONSE WAS THAT THE
EXPLOSION IN NEW TECHNICIAN CLASS LICENSEES SINCE THE ADVENT OF THE
CODELESS TECHNICIAN CLASS IN APRIL 1991 WOULD INDICATE THAT VE
EXAMINATIONS ARE READILY AVAILABLE IN MOST AREAS. THE FCC NPRM DID
NOT DIRECTLY ADDRESS THIS QUESTION, ALTHOUGH ALLUDED TO IT IN NOTING
THAT THE NOVICE IS NO LONGER THE PREPONDERANT FIRST LICENSE.
```

THE COMMENT DEADLINE IS OCTOBER 9, 1992. REPLY COMMENT DEADLINE IS NOVEMBER 9, 1992.

SB DX ARL ARLD039
ARLD039 DX news

Thanks to Paul, K1XM, the Yankee Clipper Contest Club, Ellen, W1YL,
and Steve, KU9C, the following DX information.

BANGLADESH. S21A is active on 15 meter SSB. Also look around 14256
kHz at about 0100z. QSL via W4FRU.

NORTH COOK. ZK1RS is very active from Penrhyn Island. Check 14198
kHz between 0400 and 0500z, and 3795 kHz at 1000z. He has also been
spotted several times on 18115 kHz SSB, 10105 kHz CW and 14083 kHz
RTTY. QSL via ZL4DO.

MALAWI. 7Q7XX has been operating CW recently. Check the bottom 10
kHz of 80 and 40 meters after 2300z.

TANZANIA. 5H0ROA and 5H0ROA/A are both on, with most activity being
20 meter SSB between 14150 and 14250 kHz. 5H0ROA has also been
spotted on 14084 kHz RTTY.

LEBANON. OD5/SP1MHV has been heard around 14025 kHz between 2300
and 0300z several days this past week. QSL via his home call.

PAKISTAN. AP/WA2WYR continues to be active on CW most days. Check
around 21025, 21035 or 14027 kHz. He also operates with RTTY.

TRINIDADE. Mendonca, PY0TUP, is on the air and has been heard
working Europeans on 7064 after about 2300z. He is very
inexperienced in DXing and CW, but is trying to put in more time on
CW. License class restrictions limit his SSB operating to 40, 80
and 160 meters. He is running without the benefit of gain antennas
or an amplifier, and does not have split capability. If you hear
him on, please be patient, as he has had very little pile-up
```

experience. QSLs for CW QSOs go via the callbook address of PY1RO only. Do not send cards to the American QSL manager of PY1RO. Phone QSLs go to PO Box 108674, Sao Goncalo, RJ.24.620, Brazil.

JERSEY. Hank, PA3FWU, will activate Jersey as GJ/PA3FWU on 80 through 10 meters, including the WARC bands, between July 31 and August 8. QSL to Box 268, 3940 AG, Doorn, The Netherlands.

SOLOMON ISLANDS. Local radio amateurs will operate H44GC from 0800z Friday, August 7 until 0800z Sunday, August 9 to commemorate the 50th anniversary of the battle for Guadacanal. The operating site will be from an old base known as Fighter Two. SSB frequencies will be around 7080, 14280, 21380 and 28480 kHz. Look for CW activity 40 kHz up from the bottom of the 40, 20, 15 and 10 meter bands. For a QSL, send an SASE to K2PF.

From: brian@ucsd.edu
Message-ID: <14vv06INN11t@network.ucsd.edu>
Source record: 286798

I have to admit that the last time I went driving around Atlanta, it seemed to me that there were a lot of dead cars on the roads. I just attributed it to the poverty of the region (no money for state tow trucks, etc), but whatever the cause, there did seem to be some wide margins in the center and on the side of the roads.

On the other hand, in the area around here (San Diego), where I used to make my living doing spot news, there aren't large center dividers nor wide margins. There are spots on the freeway where there aren't ANY shoulders - the freeway's been widened to the point where to do it further will require removing hills and buildings. I've sold film of more than one stalled car that got reared and smeared.

Again, the person at the scene is the one who can judge the danger of the situation. Don't try to second-guess him. If he says it's an emergency, IT IS.

> communications receivers.

I realise that. Indeed, in many ways the Class B certification is wimpy.

HOWEVER, since the majority of computer systems normally conform to the
Class A certification level (which is even wimpier!), the fact that Apple has
taken the extra steps to certify to Class B standards should be taken in
a positive way, not negative.

Since the Apple equipment EXCEEDS Class B standards, it should be a better
choice of gear than some clone PC that just MIGHT have met Class A
standards, no?

> Bill, you come across as an Apple salesman trying to make the million
> dollar club. The little 9 inch toasters are interesting toys,

BULLSH!T.

They are serious computers. Not toys. They are the type of computers
that you don't have to be a computer guru to use. That is powerful. That
does not make it a "toy".

> You're talking to a ham audience, and that group is
> notoriously cheap. Used workstations, PC clones, and old Apple IIe's are
> the currency of their stations.

Ugh, you'd think they'd want to get their money's worth.

> Apple's pricing structure means that
> hams aren't considering them as their first choice.

Where you been, Gary? Apple's prices have PLUMMETED in the last three
years. They have aggressively priced their computers to sell. And they have
sold!

> I can get a color Sun 386i for $750 on the surplus market, I'm not going
> to pay three or more times as much for less computer.

Faugh. You get what you pay for.

If a Sun 386i is only worth $750, there must be a reason for it.

>PDZ brought to you by Flamo AvGas. Next time you're on the ground, fill
>up with Flamo".

Hmmmm, obviously, Julian is not a pilot, otherwise I doubt he would have made this suggestion. Airplane frequencies (ALL OF THEM) are very congested. A pilot has to listen (sometimes) to three different frequencies all at the same time. Not easy, especially when you only have two radios :-). However, VOR IDing is one of the things ya gotta do, and ya gotta do it sometimes WHILE you are talking to Approach and plus, you can't miss anything they're saying cuz it might be for you. Listening for a Morse code ID underneath the existing Approach banter (which is nearly constant in the New England area) is fairly easy and trivial. Listening to a VOR that talks instead is more difficult. Listening to a VOR that has weather information going almost constantly is virtually impossible (at the same time as talking to Approach). With both radios going at the same time, you can't hear either, so you miss the VOR ID, plus you miss the Approach calling you at the same time.

.....Me, I'll take the Morse code ID any day over a voice ID.

Just my opinion.

1228. any experience with new IRCs?

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-27 12:31:40 UTC
From: ginsburg@wellfleet.COM
Message-ID: <9207271234.AA02472@ginzo.wellfleet>
Source record: 286805

Has anyone received DX QSL cards using a just one of the new IRCs? These are the IRCs that are now $0.95 and are supposed to be good for minimum postage on an ordinary airmail letter in any country that recognizes them.

For those of you in Europe, do you have the new IRCs? Are they sufficient to return a single card to the US? I've been told that some European QSL managers are asking for 2 green stamps, possibly because the dollar isn't strong against their own currency and/or it costs more to mail an airmail letter from there than from the US.

Thanks and 73,
Scott WA2CJT

comp.dcom.telecom, and his latest target for insults]

>Yowch! If you'd like to give Pat a piece of your mind, address it to
>telecom@eecs.nwu.edu. He might even use it in his newsgroup.

I already did --- but don't count on it getting posted....Pat's view of
moderating a newsgroup is not keeping things to topics relating to the
group, but more along the line of posting what he considers interesting,
and trashing the rest (no matter how appropriate it is to the group).

Pat will probably see that post, which disagrees with his view (which, we
all know, is the only possible viewpoint), and trash it.... after all,
not only does it contain unauthorized viewpoints, it also cites examples....

this, of course, is why I've often wondered why I still get that group
at home....just doesn't seem worth the extra $$$ in phone bills....

but, uh, he does deserve to get a whole host of people with their
flame-throwers up on full. :-} Pat's always complaining about how much
mail he has to read....hmmm......

just as a reminder, that's telecom@eecs.nwu.edu :-)

1230. Earthquake prediction?

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-27 13:50:23 UTC
From: bill@hacktic.nl
Message-ID: <6FgJoB6w165w@hacktic.nl>
Source record: 286808

The post by Jack C. Lockhart of UC Irvine on the observed shifts on AM radio has me a little puzzled. If AM broadcasts appear to shift upto and over a full percent, I am very surprised I was able to use the carriers of KFI and KNX in LA and also KSFO in SF to calibrate my frequency measuring equipment while working on a FDM telephone carrier project. I have understood these three stationd have an atomic based frequency source, along with Loran C at 100kHz. Since Loran C, and USA AM stations all divide down to 10 kHz, doing this at the time confirmed I was able to receive the signal and phaselock it, divide by N and compare the 10kHz from two sources and find there was absolutely no continuous phase change noted between any two. (From Sunnyvale Ca. the two LA stations would phase shift due to changing distances the signal travelled) If this is a joke, then I'm a sucker, if its not a joke, I'm a real sucker, the signals at 100kHz, 560kHz, 640KHz and 1190kHz (think thats KNX) all shifted an exact percent amount! I don't think so, since the calibration was re-checked on another evening, and the counter was still correct. Somebody please do this themselves (we don't have many earthquakes in this part of Europe) and let everybody know. I refuse to believe this and I think it was made up like a tabloid story at this time.

To make my setup, it is very simple. Take a large ferrite rod and suitable variable capacitor. Amplify the preselected signal to a level that will lock the PLL system of your choice. (I used a MC1496 as a phase detector and a commercial function generator with FM input as my PLL) If you want, use another phase det. and quadrature signal from the generator to demodulate the AM signal and provide AGC to the preselector amplifier. The buffered signal from the PLL can be used to drive your frequency counter. If you use the above stations or WWV, I sincerely believe any drift you see is your counter! Enough is enough.

Oh yea, just before I left California (a little after the nice ride from the Santa Cruz mountains) I heard an interesting report about signals in the one hertz range going through great fluctuations just before that fun quake. (it wasn't fun being almost on top of it at the time, but as an afterthought I REALLY enjoyed it since almost no one got hurt and damage was very little) This aspect of prediction sounds more like science. It makes sence to me that extreme ELF might be produced from an assorted mixture of piezo electric, chemical and other sources miles underground as a result of great changes of stress below. Of course higher frequencies will be produced, but only the lowest ones will get thru the kilometers of rock below the soil. If any of you are interested in this and have enough property (and money) to make a 'proper' antenna for 1Hz, I love to hear more. I would suggest at minimum, to dig a ditch about 2 meters deep (ALOT OF WORK!) and form a circle atleast 1 kilometer in circumference. Bury as many turns of suitable wire as you care too (this is ALOT OF WORK too!). As far

as receiving you MUST of course lo-pass filter and notch at both 50 and 60Hz (yes both are strong ANYWHERE on the planet) amplify with the best 1/f opamps available (OP220's and OP221's are good choices). This signal would best be digitised and then analysed on a computer.

The above should be a nice summer project and a way for the otherwise bored UC students to drink beer and do something very productive, that may even save lives in the future!

Bill

Why does comp.dcom.telecom have to have a moderator anyway? It's only
purpose seems to be to give this Pat guy the opportunity to play god and
control the discussion. I think someone should start a new unmoderated
dcom group so there can be free and open discussion on the subject. I
know there is an alt.dcom group but not everyone has access to the alt
groups.

rliles@heimdall.mlb.semi.harris.com (Ray Liles) says:
>Why is it everyone tries to ignore rules or find loop holes?
>If you simply checkout Part 97 you will find the following:
>97.115 Music prohibited.
>The transmission of music by an amateur station is forbidden.

>Now, how simple can you get! It didn't list any exceptions ....

But notice that the transmission of information ABOUT music is
perfectly legal. In other words, it IS permissible for me to
send via RTTY or packet or by speaking (not humming or singing)
the following:

C D E F G A(440) B C
E D C D E E E(long), D D D(long), E G G(long)
E D C D E E E C D D E D C(long)

which is a rough transliteration of "Mary had a little lamb...."
In the same vein, I could send via SSTV or ATV a PICTURE of pages
of sheet music, which, again, is merely a transliteration of the
"real stuff" (music). What is prohibited is the TONES of music.

(That may still leave open the question of bagpipes!-)

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 071 (OPDX.071)
July 27, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, ARRL, DXNL, DF4RD, KB2VO, WB3JFS, WB3LHD, W8GIO, NW8F, K8YVI and K0GU & Front Range DX Cluster for the following DX information.

5H, TANZANIA. As 5H0ROA operation closes down on August 31 by the A4 group from Oman, another group will become active from Italy. The Italian group will activate 5H3CC from the mission of Father Camillo in Kipengere Village near the Livingston mountains. This is to be an all band operation which starts July 28 thru August 28. QSL via I1HAG.

5W, WESTERN SAMOA. Carlo, I4ALU, will be active from here before he goes to North and South Cook Islands (See ZK1) from August 8 to 13. No callsign has been mentioned yet. He will be active on CW only 10 kHz up from band edge on 10, 15, 20 and 40 meters.

9L, SIERRA LEONE. There still has not been any type of conformation on the rumor that the government of Sierra Leone has curtailed all amateur radio activites. The only report OPDX received was that Cecil, NW8F, spoke with Jerry, 9L1JC, on 15 meters July 18. Cecil stated Jerry did not indicate or mention this situation.

C9, MOZAMBIQUE. C9RJJ is another new station active from here. The operator is John Janssen, WA4WKY, who is with the American Embassy in the capitol city of Maputo. John plans to be active in many contests and will be especially active on CW. His QSL Manager is Paul, W8GIO, who is also QSL Manager for C9RDM and C9TDM (club station). All QSLs for the three C9 stations go to W8GIO with a SASE (use a large XMAS type envelope for C9RTM). Paul also reports that operator Oge's, C9RAJ (LA4VL), QSL cards are at the printers now, so allow a few weeks for printing and shipping. QSL C9RAJ to LA4VL's CBA.

D2, ANGOLA. Rudi, DK7PE, is now active as D2CW. There are conflicting reports on his length of stay (July 30 or August 13). Rudi is active mainly on CW and has been heard on 7005 kHz between 0245 and 0415z, 18070 kHz starting around 1200z and 21026 kHz at 1830z. Rudi is using wire antennas. QSL to DK7PE.

FM, MARTINIQUE. Jean, F5VU, will be active as FM5CD until August 10. He has been heard on 7015, 14252, 18140, 21247 and 24940 kHz at various times.

H44, SOLOMON ISLANDS. Franco, I4LCK, will be active from July 28 to August 11. No callsign has been mentioned, but suggested frequencies to listen for him are: 14003, 14260 and 21260 kHz.
Also, local operators will activate H44GC from 0800z Friday, August 7 until 0800z Sunday, August 9, to commemorate the 50th anniversary of the battle for Guadalcanal. SSB frequencies: 7080, 14280, 21380 and 28480 kHz. CW activity will be 40 kHz up from the bottom of the 40, 20, 15 and 10 meter bands. QSL via K2PF.

HD8, GALAPAGOS ISLANDS. George, KB2VO, sent OPDX the correct and complete information on his HD8 trip. He has applied for the callsign HD8VO and feels he will have no problem obtaining it. George will be in Galapagos from August 5 to 18. Then he will stay in Ecuador until August 29 and operate as HC5/KB2VO. George has sent a PC computer to Galapagos which will be donated to the DX Club in San Cristobal. He plans to operate RTTY, SSB and CW on request. QSL via KB2VO in Deerfield Beach, Fl.

OD, LEBANON. Ed, SP1MHV, and Zenon, SP7LSE, both continue to be active from here as OD5/. It has been mentioned that Ed is with the UN forces, but no word on Zenon. Both are active on SSB/CW on 20 meters various times and frequencies and OD5/SP1MHV continues to be active on 18130 kHz around 0030z.

SV/A MOUNT ATHOS. (The Saga continues!) A letter from Monk Apollo, SV2ASP/A, sent to the ARRL appeared on UseNet and was also printed in "The DX Bulletin". The letter stated there will be no more operations from Mount Athos by Greeks and foreigners, only the Monks of Mount Athos will be able to operate. Also, Apollo continues to state that there will be no operations from Mount Athos at all unless the ARRL removes the accredited operation by DJ6SI.

TA, TURKEY. Be looking for F6BKP and FD1LRC from TA2, TA5 and TA6/HC until July 31st. QSL via FD1LRC: Caillon Bernard, 5 rur des Iris, 44190 Getigne, France.

VK9, MELLISH REEF AND WILLIS ISLAND. In the beginning of the week there was some surprising news being reported on some of the DX nets. Jim Smith, VK9NS, may have to cancel out on his DXpedition to both Mellish and Willis. Apparently, the funds are not coming in as expected and the possibility of a NO GO may happen. There was no word on whether this will effect Jim's DXpedition to Heard Island. Stay tuned!

ZD8, ASCENSION ISLAND. Jim, N6TJ, is now active again as ZD8Z. He will be there until August 5. Most of his activity so far has been on 15 and 20 meters CW/SSB. Look for him on 21035 or 21249 kHz between 1730 and 1930z and on 14035 or 14225 kHz between 2100 and 0300z. He has also been spotted on 10105 kHz around 0100z. QSL via VE3HO.

ZK1, NORTH AND SOUTH COOK ISLANDS. There may be more activity from these islands. Carlo, I4ALU, and his XYL will be visiting the Cooks from August

14 thru September 1. Carlo hopes to operate from both North and South. He only operates CW. He plans to be active from Raratonga Island (OC-013) and Aitukati Island (OC-083) in the South Cook group. Meanwhile, look for Bob, ZL4DO, signing ZK1RS (QSL via ZL4DO) from Penrhyn Island (North Cook). He has been heard around 3795 kHz between 1100 to 1245z, 7064 kHz around 1230z (net), 10105 kHz around 0400 and 1130z, 14200/14226/14240 various times, 18115 kHz at 0330z, 21300 kHz at 0230z and 24935 kHz between 0200 to 0330z. ZK1XR (QSL via N7NKG) is also on North Cook.

ZY0, FERNANDO DE NORONHA. ZY0RW has been quite active from Atol das Rocac (SA-038). Check 3798 kHz around 0100z, 14022 kHz around 0200z and 14260 or 21295 between 1930 and 2030z. QSL via PT7WA.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

I can't agree with you here Brian,

Not being a member is like putting an attenuator pad in the coax
that is full on. No-one is going to hear you.

There are really two pieces to the puzzle to get your point accross.
One, you have to be a member because that lets you take part in the
second aspect..voting. The folks who RUN the league are the directors.
They are elected officials. The people that vote are the voices that
are heard. (though phone calls do keep the issues ever present in
their minds ;-)

[deletions]

Is an alkalai earth group metal, like sodium and cesium. Years
ago, while still in high school, I developed a fascination with
that group and my chem teacher gave me some pieces to play with.
Brittle stuff that develops a crust in air. Didn't react with
water as much as sodium -- hah -- so I tried vinegar. That got me
a bit scared since, as I recall, the reaction was strong enough to
boil the solution. And right then I realized that the sodium-
skittering-around-on-the-water trick was a lot more fun for
someone else to do -- somewhere across the room.

/ hplsla:rec.radio.amateur.misc / bryanw@IASTATE.EDU (Bryan J Welch) / 9:48 am Jul 25, 1992 /
I recently (yesterday) got a Alinco DJ-580 some of my friends told me that I would be better off with a different antenna on it. Any opinions or comments?

Also, if anyone had any mods to extend the range of the DJ-580, I would really appreciate it if you could e-mail me a copy, or where to get them.

Thanks for the help!

-Bryan Welch
bryanw@iastate.edu

I purchased a Comet CH-72S for mine. It says on it "445MHz 5/8 <lambda> 146 MHz 1/4 <lambda>". It has made a noticable difference.

That's why we don't use 911 around here but rather direct dial to
the appropriate agency!

In fact, I can hardly wait for the phone system we're installing
on my repeater. The phone is actually going to be located in
at the police station ;-) I'll bet that is going to get some
interesting comments from the dispatchers ;-)

So where did you all get this idea?

Four well-dressed men sitting together at a vacation resort. "Farewell
to Thee" being played in the background on Hawaiian guitar.

Michael Palin: Ahh.. Very passable, this, very passable.
Graham Chapman: Nothing like a good glass of Chateau de Chassilier wine,
ay Gessiah?
Terry Gilliam: You're right there Obediah.
Eric Idle: Who'd a thought thirty years ago we'd all be sittin'

here drinking Chateau de Chassilier wine?
MP: Aye. In them days, we'd a' been glad to have the price of a cup o' tea.
GC: A cup ' COLD tea.
EI: Without milk or sugar.
TG: OR tea!
MP: In a filthy, cracked cup.
EI: We never used to have a cup. We used to have to drink out of a rolled up newspaper.
GC: The best WE could manage was to suck on a piece of damp cloth.
TG: But you know, we were happy in those days, though we were poor.
MP: Aye. BECAUSE we were poor. My old Dad used to say to me, "Money doesn't buy you happiness."
EI: 'E was right. I was happier then and I had NOTHIN'. We used to live in this tiiiny old house, with greaaaaat big holes in the roof.
GC: House? You were lucky to have a HOUSE! We used to live in one room, all hundred and twenty-six of us, no furniture. Half the floor was missing; we were all huddled together in one corner for fear of FALLING!
TG: You were lucky to have a ROOM! *We* used to have to live in a corridor!
MP: Ohhhh we used to DREAM of livin' in a corridor! Woulda' been a palace to us. We used to live in an old water tank on a rubbish tip. We got woken up every morning by having a load of rotting fish dumped all over us! House!? Hmph.
EI: Well when I say "house" it was only a hole in the ground covered by a piece of tarpolin, but it was a house to US.
GC: We were evicted from *our* hole in the ground; we had to go and live in a lake!
TG: You were lucky to have a LAKE! There were a hundred and sixty of us living in a small shoebox in the middle of the road.
MP: Cardboard box?
TG: Aye.
MP: You were lucky. We lived for three months in a brown paper bag in a septic tank. We used to have to get up at six o'clock in the morning, clean the bag, eat a crust of stale bread, go to work down mill for fourteen hours a day week in-week out. When we got home, out Dad would thrash us to sleep with his belt!
GC: Luxury. We used to have to get out of the lake at three o'clock in the morning, clean the lake, eat a handful of hot gravel, go to work at the mill every day for tuppence a month, come home, and Dad would beat us around the head and neck with a broken bottle, if we were LUCKY!
TG: Well we had it tough. We used to have to get up out of the shoebox at twelve o'clock at night, and LICK the road clean with our tongues. We had half a handful of freezing cold gravel, worked twenty-four hours a day at the mill for fourpence every six years, and when we got home, our Dad would slice us in two with a bread knife.
EI: Right. I had to get up in the morning at ten o'clock at night, half an hour before I went to bed, (pause for laughter), eat a lump

of cold poison, work twenty-nine hours a day down mill, and pay mill
owner for permission to come to work, and when we got home,
our Dad would kill us, and dance about on our graves
singing "Hallelujah."
MP: But you try and tell the young people today that... and they won't
believe ya'.
ALL: Nope, nope..

I wonder how many younger amateurs can remember the original flying
circus. I certainly cant, only the repeats.

Mike G0MJW.

1242. Calcium Batteries

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-27 15:28:55 UTC
From: n4hy@idacrd.UUCP
Message-ID: <1517@idacrd.UUCP>
Source record: 286813

I want to thank Brian Kantor and Julian Macassey for their help on Lead Acid batteries. Very interesting. I recommend everyone digging through their archives and digging out Brian's posting. Julian: I think I have the issues of QST in question. I will look. Send me a note with your FAX number.

Bob

1243. Amateurs on USENET List Aug 1992 Part 1/3

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-27 15:32:20 UTC
From: mark@ve6mgs.uucp
Message-ID: <1992Jul27.153220.13094@ve6mgs.uucp>
Source record: 286735

I would be pleased to take any e-mail updates to this list. I have split this
list into three parts now. This first part contains primarily European calls
with US call districts 1, 2 and 3.

Enjoy, 73 de VE6MGS/Mark -sk-

```
# Network address to name or call letters lookup table
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# bowen@cs.buffalo.edu and beers@cs.buffalo.edu as suggested by Paul Schleck
# archived for ftp @ nro.cs.athabascau.ca:hams/usenet-hams [131.232.1.1] as
# suggested by Lyndon Nerenberg/VE6BBM
# Please send corrections/deletions/additions to mark@ve6mgs.ampr.org,
# mark@ve6mgs.ampr.ab.ca or ...!adec23!mark (depending on how the ball
# bounces :-)
# Last update July 27 1992
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
# the address that many news posters add may be incorrect, personal
# e-mail contacts or updates are always placed first in the list of
# duplicate calls. Removal of entries is by complaint only, so some
# (mainly .EDU) may be invalid over time. Some GENIE Hams are included
# (Generated by Brian Murrey/KB9BVN) in this list, their addresses are
# listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
# WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
#
# Name Name of the individual.
# Call Call letters of the individual.
# Date Last update YY-MM[-DD] International format.
# A trailing * denotes not searched in call book for verification yet, @
# means not found in my call book (1987). ? after means recheck may be required
# (eg. Call does not match name).
#

1244. Amateurs on USENET List Aug 1992 Part 2/3

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-27 15:44:29 UTC
From: mark@ve6mgs.uucp
Message-ID: <1992Jul27.154429.13358@ve6mgs.uucp>
Source record: 286736

I would be pleased to take any e-mail updates to this list. I have split this list into three parts. This second part contains primarily US call districts 4, 5 and 6.

Enjoy, 73 de VE6MGS/Mark -sk-

```
# Network address to name or call letters lookup table
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# bowen@cs.buffalo.edu and beers@cs.buffalo.edu as suggested by Paul Schleck
# archived for ftp @ nro.cs.athabascau.ca:hams/usenet-hams [131.232.1.1] as
# suggested by Lyndon Nerenberg/VE6BBM
# Please send corrections/deletions/additions to mark@ve6mgs.ampr.org,
# mark@ve6mgs.ampr.ab.ca or ...!adec23!mark (depending on how the ball
# bounces :-)
# Last update July 27 1992
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
# the address that many news posters add may be incorrect, personal
# e-mail contacts or updates are always placed first in the list of
# duplicate calls. Removal of entries is by complaint only, so some
# (mainly .EDU) may be invalid over time. Some GENIE Hams are included
# (Generated by Brian Murrey/KB9BVN) in this list, their addresses are
# listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
# WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
#
# Name Name of the individual.
# Call Call letters of the individual.
# Date Last update YY-MM[-DD] International format.
# A trailing * denotes not searched in call book for verification yet, @
# means not found in my call book (1987). ? after means recheck may be required
# (eg. Call does not match name).
#

1245. Amateurs on USENET List Aug 1992 Part 3/3

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-27 16:01:46 UTC
From: mark@ve6mgs.uucp
Message-ID: <1992Jul27.160146.13694@ve6mgs.uucp>
Source record: 286737

I would be pleased to take any e-mail updates to this list. I have split this list into three parts. This third part contains whatever is left over ...

Enjoy, 73 de VE6MGS/Mark -sk-

```
# Network address to name or call letters lookup table
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# bowen@cs.buffalo.edu and beers@cs.buffalo.edu as suggested by Paul Schleck
# archived for ftp @ nro.cs.athabascau.ca:hams/usenet-hams [131.232.1.1] as
# suggested by Lyndon Nerenberg/VE6BBM
# Please send corrections/deletions/additions to mark@ve6mgs.ampr.org,
# mark@ve6mgs.ampr.ab.ca or ...!adec23!mark (depending on how the ball
# bounces :-)
# Last update July 27 1992
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
# the address that many news posters add may be incorrect, personal
# e-mail contacts or updates are always placed first in the list of
# duplicate calls. Removal of entries is by complaint only, so some
# (mainly .EDU) may be invalid over time. Some GENIE Hams are included
# (Generated by Brian Murrey/KB9BVN) in this list, their addresses are
# listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
# WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
#
# Name Name of the individual.
# Call Call letters of the individual.
# Date Last update YY-MM[-DD] International format.
# A trailing * denotes not searched in call book for verification yet, @
# means not found in my call book (1987). ? after means recheck may be required
# (eg. Call does not match name).
#

>AA6E
>

This is a true story:

A long time ago, one of my college professors had an ACM membership card with the name "Roy's HP". (I'm not sure about the capitalization and apostrophe.)

Roy explained that he would have joined the ACM if it was named the Association for Computing Machinists. Since it was an association for
----
computing machinery, his HP calculator joined the organization.

So, if you don't like the name American Radio Relay League, don't join. Enroll your radio relay instead!

In article <jwlm0z=.stevew@netcom.com> stevew@netcom.com (Steven Wilson) writes:
>One, you have to be a member because that lets you take part in the
>second aspect..voting. The folks who RUN the league are the directors.
>They are elected officials. The people that vote are the voices that
>are heard. (though phone calls do keep the issues ever present in
>their minds ;-)

Election of directors is a binary thing - either the dude gets re-elected or he doesn't. There's no space on the ballot to say to him "get in your time machine and go back six months and change your vote on XXX or I'll vote against you." It is the responsibility of ARRL directors to pay attention to what all of the ham community wants, not just ARRL members.

Remember, the ARRL claims to represent ALL hams, not just those who send them money. Or are they just lying about this too?

So, the only way to influence a League director's position is to fail to re-elect him after the damage is done? No, if the directors aren't listening between elections, the system's already bankrupt. At some point it becomes impossible to work within a system, and the system has to be replaced.

As it stands, I believe that the ARRL has failed in its duty to ham radio. I don't believe it can change enough to repair that failure, so I'm voting against it by not supporting it. I'd like to see it replaced with an organization that is more responsive, and I've supported a few of those fledgling attempts. Unfortunately, they've all failed - the ARRL is too deeply entrenched. But I can hope.
- Brian

>Chuck, WB4UIH

Chuck, I think someone missed the point of this. Pat seems to be comparing the old (good) Internet community to the old (good) ham radio community and the new (bad) hackers to the (bad) CBers. {Words in parentheses are not necessarily my opinions, only my interpretations of Pat's}.

I'm not interested in starting a flame war, and don't even care to read alt.dcom, but that's how I read the moderator's comment. Maybe he is a ham?

Why is a discussion of USENET policies on rec.radio.amateur.misc?

Greg KD9AZ

Are there really any "datums" [sic] that are that far off? For example,
the North American datum of '27 (I think that's right) is only about 30 meters
away from its successor. I didn't expect there to be cases where the
difference is enough to move you from a prudent distance away from rocks
onto those rocks. Could you give an example?

A friend of mine was ran into a similar problem. He was on one of the islands in Lake Michigan, off Traverse city, and the only repeater he could reach with his handhels was as "backdoor" link that one of his neighbors had set up. He was listening on the link when he heard someone trying to shut the link down, and not ID'ing. When my friend spoke up, the offending party dissapeared and never ID'd. Fortunately, the DTMF codes for the link had just been changed.

I had an interesting experience on 20 meter CW the other day. I was having a
nice QSO with a ham in Canada and after he turned it over to me another ham
sent LIDS. I thought may be he sent solid, so I sent ??. He sent lids again!
I didn't reply to him but did mention it to the ham in Canada. He said Ok then
I challenge that idiot here and now to a speed CW contest. So he signed with me
and I signed off and sent " Ok clown go ahead if you have the guts" ! The guy
in Canada started flying at about 50 wpm and then stopped. Dead silence!
I sent HI HI de AB6MB and he replied HI HI. Got a kick out of that.

Pat is not a ham, and I think he's painted the hobby with somewhat of a broad brush (whether he meant to or not). My original message on the subject was cross-posted to rec.radio.cb, due to the mention of the CB service as well. I accidentally forgot to add a Followup-To: header back to the ham group. Please don't compound my mistake further by blindly following up without noting (and editing, if necessary) the Newsgroups: line.

>Why is a discussion of USENET policies on rec.radio.amateur.misc?

Because discussions of Usenet policies emerge in EVERY newsgroup. The fact that we are unmoderated makes the phenomena of runaway tangential threads that much worse. I apologize for inadvertently setting off an "I hate the Telecom Digest Moderator" thread. I've sent information to the followup poster about how to go about creating a new newsgroup, and I hope this thread will die a quick death.

|>
|> 97.115 Music prohibited.
|> The transmission of music by an amateur station is forbidden.
|>
|> Now, how simple can you get!

Has the thought ever occured to you, that by the time this
particular ruling was adopted, there were no autopatches,
and no music sound while put on hold?

|> It didn't list any exceptions (autopatch music, etc.).
|> It doesn't allow *any* room for interpretation. It doesn't say
|> *broadcast* it says *transmission* of music.

The strictest interpretation most often is not the smartest.

Also, could you explain how your "transmission" is not
"broadcasting" [since anybody tuned to your frequency
can (and will :-) receive it]?

Or are you "interpreting" that "broadcasting" must mean
"commercial one-way transmission"? (:-)

|> So, until the rules are changed, let's try to abide by them.

So when the situation changes - let's bring the rules
in sync with it.

>
I think I was wrong in what I said above. After reading the previous posters
comments about 100-300 Meter accuracy, and sticking my foot in mouth claiming
much better results, I decided to watch the thing for about an hour while
eating lunch. Sure enough, although most of the time the readings were
within 1 or 2 100ths of a minute of latitude (each 1/100 is about 60 feet), it
would occasionally "drift up or down from the "fix" by consideraable amounts.
The total span during the hour I monitored was about 10/100 of a minute, or
about 200 meters. If I had watched longer I might have seen the 300 meters
claimed. A lot of this variance is due to the position of the sats not
being ideal (the GPS50 estimates the amount of error due to this, which was
about 180' at the time of the 200 meter drifts, ie not enough to account
for the observation), ie if the visible sats are not spread out in different
directions, it can't triangulate your position as well. Anyway, I must
have been extremely lucky to get my previous observations. The thing just
isn't quite as accurate as I first thought. It is still a great toy, however.
I love it.

A couple of years ago, I got on our local 440 Mhz repeater and
gave the legendary W2OY "No lids, no kids, no space cadets; no
users of the FO-NET-ICK alphabet..." CQ. Ken, one of the regulars
on the repeater, came back to me totally aghast and said "How do
you know about that CQ!?".

It seems that W2OY was an ELMER!! He had sponsored Ken as a young
ham and had given Ken his Novice test. Ken said he had spent many
an hour in W2OY's shack while he gave his famous CQ but had never known
that OY was a celebrity. It completely blew Ken's mind to realize
that there were people out there who actually listened to W2OY: I was
the only other ham he'd ever heard that infamous CQ from (Hmmmmmm..).
He also said that OY was quite loony -- lived in a house that looked
like it was out of the Adams family, old newspapers and junk stacked
from ceiling to floor, with narrow pathways cleared through the clutter.
He had many a free lunches at the house and was always welcome.

Ken said the OY had electrocuted himself while working on an antenna.
He realized the guy was crazy but had a soft spot in his heart for
all the time he'd spent with an old man who just seemed to be a
couple of bubbles off plumb.

I never talked to W2OY. When he was in his prime, I was 15 years old and the guy would never come back to "Whiskey Two Onomatopoeia Yugoslavia, this is Whiskey Bravo Two, ahhh no, make that Whiskey Alpha Four, yeah, Whiskey Alpha Four Z, Zebra, C, Charley, L, London"...

I am *NOT* a student at the University of California, Irvine and I do
NOT NOT NOT NOT drink alcohol. I am a staff employee in the Office of
Academic Computing, Network & Telecommunications Services and my title
is 'Radio Systems Engineer'.

>
>

> Bill

There has been research on the subject of EARTHQUAKE FORECASTING and MONITORING FOR EARTHQUAKES. A summary is attached.

MONITORING FOR EARTHQUAKES

Vince T. Migliore

Earthquakes are sometimes preceded by and linked with curious electromagnetic signals in the lowest frequency ranges. These signals can be detected using equipment found in many ham radio sources. If you are interested in participating in experiments that may be able to detect seismic signals and even earthquake precursors, then read on.

A growing body of scientific evidence now points toward the possibility of predicting major seismic events based on low frequency transients. Probably the most widely known investigation was conducted by a team headed by Anthony Fraser-Smith of Stanford Star Lab. This study found distinctive patterns in the 0.05 to 10 Hertz range (yes, Hertz, not kHz.). The Fraser-Smith study was based on experiments conducted in the Soviet Union, which in turn grew out of folklore from China and Japan. Joe Tate and William Daily found anomalies in the 1 to 10 kHz range, while other experimenters report signals up to 100 kHz. Among amateur radio operators there are many anecdotal incidents of earthquake transients all the way up to the HF range.

Although there are several segments of the electromagnetic spectrum where earthquake anomalies have been detected, not all of them have been verified by scientific experiments. This provides a unique opportunity for amateurs to make some really significant contributions to science. The frequencies to look at are:

1. The 0.01 to 12 Hertz range. Joe Tate, and Anthony Fraser-Smith have done successful research in this range, but it can be extremely difficult and expensive. The Schumann resonances come into play, man-made interference is a problem and specialized digital equipment may be necessary. On the other hand, several professional investigators agree that this range is productive for seismic transients. Magnetic transients in this range look very promising.

2. The audio range portion of the electromagnetic spectrum, 200 to 15kHz. Several experimenters have been monitoring this range, and some report distinctive thumping sounds prior to earthquakes, especially between 8 and 12 kHz. A Japanese study claims to have detected quake signals in this range. Recently, two investigators reported an unusual hissing sound in this range prior to the recent quakes in California.

3. In the 30kHz to 150kHz range there are reports of paradoxical drops in background noise, increases in noise and static and sudden bursts of energy lasting several seconds.

The problem with earthquake monitoring is that seismic events in any one particular location are extremely rare. On the other hand, it may be possible to detect earthquake related transients quite far from the epicenter. Further, even a small number of experimenters, with automated recording devices, will be capable of monitoring over long time intervals, and this increases our chances of capturing important events.

What to listen for: In the audio range, listen for hissing, thumping or rumbling sounds that last for over 1 second. If you can leave the receiver tuned to the same frequency, listen for dramatic increases or decreases in the noise level, especially those that last for more than a few hours. You will soon realize that real time monitoring is not very efficient, so look to driving a strip chart recorder, or even sampling to a computer. If you decide to interface to a computer, you'll need an analog to digital (A-D) converter, but these are now available as add-in cards for many computers, some under $100.

Geophysicists that I've spoken with are at a loss to explain any mechanism that might account for electromagnetic and magnetic disturbances, but some theories are the piezo-electric effect of crushing and bending of quartz-containing rock in the earth's crust, the flow of magma beneath the crust that may contain varying amounts of metals, and the interaction of the earth's magnetic field with the solar wind. None of these models however is fully satisfactory. By organizing a good sized network of amateur monitors, we may be able to shed some light on this exciting new science.

Geo-Monitor is dedicated to earthquake prediction, amateur geo-physical monitoring and earth mysteries. In addition to ULF monitoring, we are looking at solar activity, lost pets and changes in HF propagation. If you want to participate in on-going experiments (or just to share ideas) please write to me. For a sample issue, please send $2.00 to Editor, Geo-Monitor, Suite 400, 65 Washington Street, Santa Clara, CA 95050.

Is this supposed to have anything that you can't get out of the ARRL repeater directory? Only $6.00, pocket size, lists more repeaters on more bands than I'll ever use.

If you want something with the ability to get repeaters sorted by frequencey or call, i.e. database queries, have you asked ARRL about availability of their database for use by a server somewhere?

Message-ID: <9207272028.AA25501@ucsd.edu>
Source record: 286743

Does anyone on the net have any info on the IC-2SRA?
The receive is supposed to be 50-905 MHz. Are there any
gaps in this range? (The literature doesn't show any.)
Any info on it's strengths/weaknesses would be appreciated.
Thanks,
Linda, AA6MR

My MFJ 9020 finally arrived last week (I ordered it in early June). The receiver
is very good; you WILL want the extra audio filter. My tent-pole vertical with
only three radials did not get out well enough for anyone to hear me, so I have no
signal reports from this weekend's operation. Overall, the receiver sensitivity
about matches my Yaesu 767 without the extra RF filter.

One problem is the sidetone volume, which varies with the AF gain setting. At high
gain values (normal for dx) the sidetone is deafening. There are also very loud
TR clicks at high gain settings.

Stability is OK -- there was some drift during outdoor operation (over a temperature
range of about 30 degrees), but never enough to lose a signal.

On my unit, as delivered the speaker wiring interefered with the tuning capaciter,
so that you could not tune the entire band. About 2 seconds with the cover off fixed
the problem, but it may indicate some QC problems.

Some people just don't seem to be able to think on their own!

I have and will continue to use our phone patch to help anyone on the roadside. I don't care if they call the dealership, AAA, Joanne's Flower service, or GOD on the damn thing. They need help! I'm not making any money, and most of all it's excellent PR for ham radio. If some religous type kills the patch, which they don't have the codes to anyway. I'd give them a real emergency to call 911 for.

Part 97 wasn't written in stone 2000 years ago. The FCC doesn't walk on water. Get a life! Ham radio is a hobby. I'm not in the military, so bag your blind unthinking rule/order following.

Music on hold is never a problem with us, it just times out the LL side timer(safety net). We didn't plan on it, we don't take requests, ads, or play discs. We are not broadcasting music. Next they will start complaining about phone answering machine outgoing messages. As said above, get a life!

Mark

1275. (Recent and complete) Part 97 online?

Hold it! Put down the flame thrower!

Now, I read the FAQ, checked with ARCHIE and FTP'd every copy of *97* I could find. Some are .TXT, some .ARC, some .ZIP, some have DOS CR-LF combos, some have UNIX style LF's. But they all appear to be the same version.

Granted when two sites had files with the same name, date and file size, I didn't bother to get them both, but, all of the ones I did find a) matched, b) date back to about 1988, c) had:

SUBPART E Prohibited Practices [[goes here]]

where 97.108 - 97.160 would be, d) had no mention of the Tech without HF, and e) still list the old 220 Band.

Hence, the question: Is there a recent and complete Part 97 text online?

OK, if I missed something or did something stupid, NOW you can flame me. But do it via email, please. I get more that way and it saves bandwidth. ;-)

Gang,

in responses to my posting last week, i was surprised by the number of questions on QRP ARCI! seems like a bunch of the gang here on the net haven't heard of them, etc.

the QRP ARCI (Amateur Radio Club International), a worldwide club for QRP'rs publishes a quarterly journal called the QRP QUARTERLY. the club promotes QRP contests, experimentation, etc. membership doesn't prevent you from owning and operating high power rigs, etc.

QRP, as defined by the club, is 5 watts out for CW and 10 watts out for SSB and other modes.

membership is $12/yr and available by writing to

Mike Kilgore, KG5F
2046 Ash Hill Rd
Carrollton, TX 75007

other QRP clubs are

Michigan QRP Club
PO Box 80804
Lansing, MI 48908-0804 and dues are $7/yr

G-QRP Group, United Kingdom group
Luke Dodds, W5HKA
2852 Oak Forest
Grapevine, TX 76051 $12/yr membership dues.

This posting not an advertisement for the above (flame suit on). Just posting for information for those who don't have it readily available.

73 and 72,

Yeah, remember, the next time you want to fight a state law
banning ham raduios in cars, cell phones are cheaper. And
any way, nothing short of a natural disaster warrants using
your 2 meter rig for anything other than discussing your gall
bladder.

The demise of amateur radio has oft been predicted,
if it comes, it will be driven from within.

availability of their database for use by a server somewhere?

I doubt the ARRL info is in any kind of a database file on disk.
There are too many duplications in the California info. The
way they have the info from the coordinators listed, our area
(central CA) shows up in both southern CA and Northern CA listings.
Seems like a waste of space and paper. I'd love to see it in machine
readable form. I've thought of doing CA myself, but lack the time.

I suppose that if there is a call box fairly close
(you decide where fairly close is) but in one of the
ARRL publications (I think it was Now Your Talking)
they indicated that if your car has broken down then
by all means call a tow truck on the auto patch.

I have seen many people die while waiting in their car
after they broke down. (note: I did not see say
one car hit another as such but I have seen the
resulting destruction).

1283. Field Day '92

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 02:16:49 UTC
From: wws@craywr.cray.com
Message-ID: <1992Jul27.211649.7861@walter.cray.com>
Source record: 286757

Many of us would enjoy hearing about others Field Day activities.
Only a few have been posted to the net so far. And I'm very interested
in people's perceptions of the band conditions that weekend.
Let's hear more!

Our group (W6YL/N6XVK) headed to a new mountaintop site this year.
Not as high as our old site, but with much more room for antennas.
It also had an excellent view to the east. We had been up to the site
twice before FD. Both times there was a light pleasant breeze and it
was quite warm.

The first incident involved the lock on the gate. We had our
own combination padlock in series with others on the gate. We had
permission to do so from the owner of the property. When we arrived
our lock had been cut out! Fortunately, one of us had a key for one of
the other locks so we were able to get through. I had to find a
locksmith shop to get a new lock. No big setback.

There was about two miles of dirt road leading up to the site, some
of it very steep. We thought it would be easier than our old site
which had 5-6 miles of dirt road. In fact several cars didn't make
it and had to either turn around or be pulled up. My XYL's Corolla
made it without any problem (sure am glad she didn't come along.
She would have had a fit!). One ham punctured his fuel tank and had
to drive home. Unfortunately he was also the one bringing the food!
(He did return in a truck in remarkably good spirits!) Together about
18 hams, S.O.s, and kids eventually made it up the hill.

This year we decided to abandon commercial antennas for the main
HF rigs. It is too much of a pain to take them off people's towers.
It is also painful when they come crashing down accidently, as had
happened to a KLM KT-34 we used last year. And in the spirit of
FD, it is fun to see what you can do with easily portable stations.

It was an awesome sight seeing several thousand feet of wire and
rope in the air. We were well prepared to tangle with any Extra-class lids
(or other contest haters) who might try to jam us on 40 or 80m.

About the time we started setting up the antennas, the sky began
to get very cloudy. The wind came up. We had set up on a flat spot
between two peaks. This flat spot seemed to act like a wind
tunnel. I wish I had brought some sort of wind gauge because it
must have been at least 50 mph! The antennas survived quite well,
though sometimes they were not quite in the same shape as we had
modeled in NEC. The really bad part of the wind was the constant
flapping of the tents. This made headphones mandatory.

Also, being much lower than our old site, we were in the fog at
night instead of above it. Cold, damp, windy, and no star watching. :-(

We operated continuously the entire 24-hour period. I was logging
at the time the earthquake hit. We were working up and down the
coast on 80m with our eastward pointing antenna (80m never opened for
us to the east coast - our beautiful design for 80 was largely wasted.)
An OM from Southern Cal. asked if we had felt it. Since we were
literally a mile or two from the Hayward fault, if anyone had felt
it in Northern Cal., we would have. We worked several more
stations in Southern Cal. Everyone was comparing notes. One guy
said he had literally been knocked out of his chair!

It was pretty weird being in the middle of an emergency communications
excercise and having a *real emergency* hit! We did keep tabs on the
quake as a side effect of being on 80m. But no traffic was forthcoming
from the affected area. The reports indicated that the epicenter of
the quake was way out in the desert. So we kept on operating.

The 40m antennas were ruthless. When the bands were open we had no problems.
No OFs tried to jam us this year (maybe they remember the licking we
gave them last year... And we had bigger antennas this year,
just in case. :-)

The phone station was not as effective on 20m as we hoped. Some signal
reports from the east coast were of the 'strongest sig around' sort,
but many contacts had problems. I don't think it was due to band
conditions (like last year) because the CW station worked very well.
In fact, the CW station worked far more people on 20m than the phone
station did. Obviously some 20m antenna work is called for.

But when 15m opened up the last couple of hours, the phone station was
awesome. We seemed to have total command of the band. Our QSO rate
was over 110 per hour! The CW station also did well, but the phone
station really made up for the 20m embarassment by it's performance on 15.

The OSCAR station also did well. This was the first time our group has
had an OSCAR station, but everyone really had a lot of fun with it.
This despite the fact the the satellite element data that we had was
totally bogus. It doesn't seem like most people use logging computers
with OSCAR, we didn't either, because when we entered the contacts
we had quite a few dupes. It's too bad that phone and cw are not
counted seperately on OSCAR - we had dupes between modes as well.

On sunday morning, 10m opened up and the novice station (N6XVK) was
really hopping. The Novice station worked some CW on 40m.
We also worked several dozen packet stations.

I don't have the final point tally yet, but it is easily in the 7400+ range
for class 2A. A new all time high for our group.

Oh yeah, the wind died down about 30 minutes after the end.

>
>Anyone know where to find the Mods to make the VFO stable? K9ALD

I had a 753 which I purchased in High School in 1966. The rig put out
a very potent signal and I could always talk to anyone I could hear.

The tube VFO was, by the time I bought mine, replaced by a transistor
VFO. If you still have the tube, you can get an order of magnitude
improvement by replacing it with the transistor version.

About 5 years ago, I finally gave the radio away at a swapmeet (Gave
it to a poor Novice - probably discouraged him for good). Anyway, with
it went all the dozens of letters between me and EICO and copies of
shippers as I sent the rig back to them 3 three times so they could
work on the VFO.

Your best bet is QST and CQ magazines of the 1966/67 era. There was
a good article in one of them about the drifting VFO and what could be
done. EICO also had a technical bulletin which talked about it and
other fixups for the rig.

From what I remember, the general plan was to replace all the
inductors with physically larger versions (and supposedly less
heat sensitive). The second thing was to replace the NPO caps
with caps with different NPO coeffients until the drift was within
spec. Third was to replace the PCB with a thicker version. EICO
also had hand picked transistors.

Within spec had an unusal meaning to EICO at the time as well. What
was considered good back then would not be acceptable today.

Good Luck and 73, mark K3FWT

I chartered a boat in Greece recently and the "Greek Waters Pilot" (for
Yatchsmen) warned that the Loran or GPS co-ordinated could be 1.5 miles out,
relative to the charts, as the charts are based in 1850's British Admiralty
surveys. North American charts are probably better than this!!!

I agree with Paul. People who are abusing radio whether it be
amateur radio, cb or whatever need to be educated in it's proper use, rules
and regulations. If they don't follow them, they need to be found and
removed (legally of course :-).

Besides that, the original statement made by Pat as well as yours
smell of stereotyping. Yes, I've been in areas such as the San Francisco
Bay Area where there are obnoxious 2m users breaking every rule and regulation
made. I remember scanning through a bunch of repeaters in Fremont on my
way out of the Bay Area heading back to Chico when I heard a repeater playing
music for quite a while. People were cussing on it, etc.

However, other areas such as where I live (ie Chico, Ca) have, for
the most part, a very nice, educated, polite group of amateurs who do credit
to amateur radio. And I might note that many of these individuals came from
the ranks of CBers.

Source record: 286770

IMHO what the FCC and ARRL should do is instead of trying to map the
US license structure into the license structure of each European country,
they should simply map it into the CEPT license structure.
The majority of European countries are signatories of the CEPT agreement
which essentially defines two ham license classes (30MHz-and-up nocode
and HF-bands with code) and also gives reciprocal privileges in most cases.
Makes life a lot easier, specially when you travel through six different
countries in a 24 hour journey.

With the emergence of post-communist governments in much of eastern Europe,
chances are, before long a CEPT-type license will be valid as far east as
the Urals..

> >and carve cats' whiskers out of blocks of galena.

SORRY 'BOUT THIS BUT ... One doesn't carve cats whiskers out of blocks
of galena. The cats whisker is the spring steel wire used for contacting
the surface of the galena crystal. Of course, one could carve the CRYSTAL
from a block of galena.

Don't mean to be picky, but, hey guys, we gotta let these young
whippersnappers know the straight skivvy 'bout this stuff, right??
I mean, how many radios today can be operated without batteries or any
other means of power?? And my slide rule is still going strong without
a battery change even after all these years.

Anyway, as one of the oldsters who ACTUALLY REMEMBERS poking around
the surface of a galena/iron pyrites crystal with a cats whisker, and
suddenly hearing the old WFBR station (Baltimore) in the "cans", I just
want to thank the originator and all the contributors who have added
to these postings.

R.I.P., Graham Chapman!

1300. Re: Is it "business" if I use and autopatch to ...

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 12:57:27 UTC
From: waco@cbnewse.cb.att.com
Message-ID: <1992Jul28.125727.21550@cbnewse.cb.att.com>
Source record: 286772
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

There has been discussion on this topic regarding whether a disabled auto constitutes and emergency. If I remember Part 97, the rulse defines an emergency as any threat to life or property. I once used the autopatch to try to contact an Amoco station for a lady whose car was disabled on the shoulder of an interstate at rush hour. Seeing the idiots that drive on the shoulder, etc. at rush hour, I know she was in danger. I was unable, for reaons I forget, to get help directly from a local Amoco station and ended up calling the Illinois State Police and asking them to get her an Amoco tow truck. One guy did then tell me I had made an illegal autopatch to a service station, luckily he did not kill the patch. I told him I considered it legal and I still do.

As to the danger part. Yesterday a GM van stalled on the Eisenhower expressway in Chicago and was on the shoulder of the inside lane. A car rear-ended the van. Having just driven this expressway out of Chicago Sunday night, I can understand why the car was driving on the shoulder; there are real idiots out there that pass regardless of the fact that only the shoulders have no traffic. The driver of the van was thrown out the back of the van and ended up pinned between the car and the van. The driver's seat of the van ended up on top of the hood of the car. The driver lived, but was in critical conditon. It is NEVER safe to be on the shoulder of a busy road, especially an expressway. It is definitely an immediate threat to life or property.

>listen to that? You aren't trying to land you plan with your scanner
>are you?

My local airport has ATIS on 110MHz. This is a low power *voice* signal with up-to-date information about various conditions at and around the airport, including approach and departure frequencies, etc. How hard can it be to add 108-118 coverage anyway?

Dave

1305. Telephone RFI information and reports sought by ARRL HQ

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 13:56:01 UTC
From: ehare@arrl.org
Message-ID: <316@arrl.org>
Source record: 286558
Cross-posted to: rec.radio.amateur.misc,sci.electronics

ARRL Atlantic Division Director Hugh Turnbull represents Amateur Radio on the ANSI C.63 Committee that is developing voluntary standards for interference immunity. This group is meeting in Anaheim at the EMC Symposium on 8/17. They plan to discuss the formulation of voluntary standards for telephones and related equipment. Hugh wants to get information about the interference problems that amateurs have been experiencing with telephones.

If you have had a problem with telephone interference, please send a report to ehare@arrl.org (email or letter). (This includes problems in your own home, not just with a neighbor.) If possible, include telephone model numbers, a brief description of the transmitting station (if there is one involved -- many interference problems stem from electrical noise), and a brief history of what has been tried to date, or what type of filter solved the problem.

If you include your postal address, I will send you our complete RFI Package, and refer any unresolved interference problems to your section Technical Coordinator (if there is a ham involved). This offer extends to any newsgroup readers that need it, not just those who have a telephone interference report.

Thank you for advance for your help. A handful of people here in Connecticut can't solve the world's problems alone. We need the rest of the League (and the amateur community) to give us the ammunition we need. If you have info that can help, please take a few minutes to put it together and send it off my way. It really will make a difference!

The specifics of the ARRL National in Los Angelas were not mentioned in this month's QST.

Does anyone know where exactly in LA it is to be held?

Comments appreciated,

The list maintainer might wish to email each of these folks to see if:

1) They want to be on the list (personally I don't mind, but it might be courteous). Yes it's freely available data, but someone could misuse this by building the Mother Of All Mailing Lists....

2) The listed adress is anything reasonable.

Frinstance:

smith@sndpit.enet.dec.com (Willie P. N. Smith) n1jbj 91-12-6

this has been obsolete since at least 91-09-something, and has been reported to the maintainers.

wpns@pictel.com (Willie P. N. Smith) n1jbj 92-1-7

Ah, that's me!

There are minor errors in a couple of other entries with which I am conversant [Hi Marco and Kim!] as well. Basically any address more than 6 months old is suspect, and any more than a year or two old is probably marginal at best.

Willie

>are you?

There's plenty of voice piggybacked on top of VORs. It's hard to copy most of the time, since they have to keep the modulation down to avoid trashing the VOR signal, but it's there. The ATIS (Automatic Terminal Information Service) at the VOR at my home field, Ellington Field in Houston, is one example. Other VORs have weather broadcasts, and most all of them can be used to transmit voice to aircraft who've lost their comm receive capability.

I'd suggest that your definition of an emergency is very limited and
not in sync with what most hams would apply in a common sense view.
As many others have mentioned, vehicles on the side of any road (especially
interstates) are always a potentially dangerous situation. If the
"breakdown" does not require medical attention then why call 911
and place greater time and resource burdens on those folks. Call
the tow service, AAA or whatever.

Anyway, I understand and respect your opinion,
but it is not what I would do in a strictly mechanical breakdown
case.

My experience is that they radiate equally poorly with the outside
element present or not. The coax in the car does most of the radiating.
Others have other opinions. Mine is to grab that drill and cut that

>willingly entering into. It's not like restrictive ordinances which can
>be passed after the fact.

Actually, there may be very good grounds to fight them. If there
are already numerous "non-conforming" antennas in the subdivision
then the CCRs may have no impact because they have not been enforced
for too long a period. Likewise, if the original "enforcing"
entity (eg. owner's association, architectural jury, etc.) is
no longer in existence, then there may be no methodology for
the enforcement of the CCRs and hence they become a moot issue
by default. Anyway, I'd have a good local attorney look at the situation
and provide the advice on any specific property you might be
interested in.

This is just my .02 and NOT legal advice.

EMI-resistant telephones

Radio Shack Model: ET-171
Catalog: 43-374A, 375A, 376A, 377A
Model: ET-141
Catalog: 43-595

Reports from ARRL Technical Coordinators indicate that these telephones have a high degree of built-in immunity. This is not necessarily guaranteed by Radio Shack. Other Radio Shack telephones have not been tested.

TCE Labs Model: TPXL - one line, wall or desk
RR9 Box 243D Model: TPXL-2D - two line, desk
New Braunfels TX 78133
(800)KILL-TVI

TCE Labs telephones are guaranteed to eliminate RFI or your money back.

OLD AT&T telephones, made by several different companies, notably models 300, 500 (rotary), 2500 (DTMF), 2554 (DTMF wall phone,). These phones are made by AT&T (Western Electric), Comdial (Stromberg Carlson), Northern Telecom, and ITT. These phones have no semiconductors in them and have a carbon microphone. Hence the RF immunity. The only devices that can produce problems are the silicon carbide varistors. Most of these phones are no longer being manufactured but are sometimes found used at garage sales or flea markets.

1322. Comments on ICOM IC-2SRA

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 17:21:50 UTC
From: stone@Apple.COM
Message-ID: <70550@apple.Apple.COM>
Source record: 286688

Oh Hi,

I've had a 2SRA for a while now and I really like it. The scanner section actually goes from 25mhz to 950mhz- no gaps. It works well, I regularly listen to CHP on 42 mhz. The are good things and bad things, I'll list them.

Good things

The 2m section has extended receive range typical of current day 2m rigs

Both sections can operate concurrently.... this is great. For example, when in the forest, I use the scanner section to search for rangers, when I find a freq. I put it in the 2m section and have the 2m section scan the memory channels of new freqs.

It has tone squelch... it will only stop scanner if the proper subaudible tone is detected.

Has a signal strength meter

The display light can stay on for ever if you want

When searching between two end points you can delete freqs that it stops on that you don't want... a very good feature.

You can just enter a frequency to listen to it with out putting it in memory, I wish you could do that on RS scanners

Bad things

Hokey antenna mount, 1/8" headphone jack, for the scanner section. I thought it wouldn't last, but it seems to be doing okay.

It doesn't have "banks" like the RS scanners. Also, it is down on memory channels- 60 for scanner 30 for 2m. But since you don't have banks I don't miss the memory.

Summary

I've had a PRO 34 and an AOR1000. I like the 2SRA the best. I bought it as a scanner, however having the 2m just sitting there motivated me...

For Sales
Kenwood TS-711 2 meter desk top all mode transceiver.
FM / SSB / CW 25 watts, built in 110 vac power supply,
Works on 12 dc also. mic, Kenwood box, cables.
Works great. Makes a very nice contest or Oscar radio.

For sale
Yaesu FT-209 2 meter hand held radio. Good condition.

For sale
AOR AR-1000 All band scanner. 5 MHz to > 950 Mhz
AM / FM / FM Wide. Will cover all normal publis service bands
as well as military aircraft, vhf aircraft, FM broadcast,
TV Channels, 800 mhz. I have enen used it to listen to
the BBC on 9.640 MHz AM !
Excellent condition. With case, charger, manual.
By the way this is a handheld scanner.

email to georgez@synopsys.com or call direct

I'm interested in learning more about the Collins line of ham gear. Can anyone point me to (or summarize here) some documentation on the various models and their features. I keep hearing of references to "s-line" , or "KWM-2A" and such but really have no idea as to the type or vintage of these rigs. Did Collins survive until the digital age?

BTW, I have only been a ham for about 3 months now (General class), and operate with a Heathkit SB-102.

Personally, I'm hoping they _do_ change it to AARL, because that's generally how I end up pronouncing the letters in ARRL anyways -- there's something about double-R sounds like that that just trips me up something fierce (I have trouble pronouncing the word 'rural', too...) :-)

...
>When I hear people starting to get shrill about getting youngsters
>involved in ham radio, I often take note, especially when they start
>talking about CW being an obsticle. I think this problem with the
>heavy [technical] language is much more of an issue than CW for kids.

A good example is a father/son team (friends of mine) who recently got
their ham licenses. Eli (the son) had no trouble with the 5 wpm, but
missed the Tech exam, so ended up as a Novice. Bill (the father)
is an electrical engineer, so he had no trouble with the Tech exam,
but couldn't pass the code. Now Bill and Eli are looking for
220 MHz radios so they can talk to each other on the air!

I expect this story is repeated many times across the country --
It's the "old farts" who have trouble with the code. Young minds
are well-optimized for learning new languages (like Morse), but
have more trouble with electronics theory.

That's not entirely true. Pat has many times passed on dissenting posts.

There *ARE* problems in the ham bands. I think it is more a difference
that Pat has just given up on it (and not considered even becoming a ham
for instance) whereas we have not (yet, apparently) given up.

>numbers are entering our ranks from the youngest cohorts, and because

Thanks for reinforcing my argument. You are saying that one reason
the ham population is older is that we (of course) are not attracting
3-year-olds into amateur radio.

>hams, on average, don't live as long as the general population. You've

Exactly the opposite. Milham's famous study (the one that was purported
to show that ham radio cuses cancer) nevertheless found that hams live
longer than the general population. (Die less often from other things.)

>neglected to shrink the size of the older cohorts to account for death.
>When you do that, and discard the lowest age cohort, the average age of
>hams should be 39. ...

Even with your assumptions, this is not true. In a steady-state case
(where amateur radio has existed longer than the maximum life span),
the only way for the amateur age distribution to mirror that of the
general population would be for amateur licenses to be assigned at birth.
(Assuming that once licensed, people will continue to renew for the rest
of their life, a pretty good approximation.)

The comp.dcom.telecom newsgroup is really just a feed to Usenet of the
TELECOM DIGEST. At the minimum the digest is formulated at one host and
sent by mail to many of the readers. Because it is mail based, there is
even more reason to moderate it. I find it has a much lower noise level
(I do not count articles I'm just not interested in as noise; I count
all those "yeah, I agree" and "no, you're wrong" posts as noise, which
Pat does filter out) than most of Usenet.

I've yet to see anyone explain how they determine this.

It does NOT SAY that it is perfectly legal, so you must be:

1. referring to case law
2. constructing a logical argument from the rules somehow
3. making it all up

If 1 or 2, please explain.

>send via RTTY or packet or by speaking (not humming or singing)
>the following:
>
> C D E F G A(440) B C
> E D C D E E E(long), D D D(long), E G G(long)

>In the same vein, I could send via SSTV or ATV a PICTURE of pages
>of sheet music, which, again, is merely a transliteration of the
>"real stuff" (music). What is prohibited is the TONES of music.

Which of the following is the correct quote of FCC rules 97.113(d)

#1

"no station shall transmit: the tones of music;"

#2

"no station shall transmit: music;"

If your rule book indicates #1, I'd sure like to see a copy of it and
especially know who publishes it (National Enquirer maybe?).

ICOM no longer has a customer service number. They do have a toll number
you have to pay for listening to their stupid answering menu system and
have to pay for while it rings into the repair center, or have to pay for
just to find out the line is busy and leave a message (of which 2 of mine
they never called back on).

Those machines should be banned.

I agree with Diana about Morse code being easier for a pilot to distinguish in the maze of chatter that sometimes occurs in the cockpit. In more than 20 years of flying in all kinds of conditions, I never had a problem with identifying a beacon using Morse code, even in the worst of times.

However, Julian is correct in stating that it could be done. In fact, it was incorporated at the Dallas VOR many years ago. The first time I heard it, I was somewhat taken by surprise to hear a throaty female voice chanting "Dallas...Omni......Dallas...Omni....." over and over. It was unique at the time for being about the only female voice you heard. I suppose that, it it had been a male voice it wouldn't have been so easily distinguishable amid the rest of the din..

> the fields is to increase the overall effectiveness of the shielding.
>

Sometimes. However, if you're getting interference in the VHF regions or above (basically anything above 30 MHz or so), I would very much doubt that the monitor deflection is the culprit. (Yes, these are some very strong pulses, but their fundamental frequency is typically around 30-40 kHz, and is VERY rarely higher than 80 kHz - and that only for high-res (1280x1024) displays. Also, the primary mode of radiation here is pure magnetic field - meaning that it's coupling into the radio inductively, and also that "shielding" in the conventional sense will do very little.

The new "low field" monitors (look for units which are labelled or advertised as complying with the "MPR" requirements - which is the Swedish ELF/VLF electric and magnetic field standard, among other things) do NOT obtain this improved performance in low-frequency E and M fields through conventional shielding. Magnetic emissions are generally held down by better yoke designs and the use of cancellation coils, while electric fields - usally a problem at the CRT face - are controlled by grounded conductive coatings (usually an indium/tin oxide coating, or "ITO") on the CRT face. The degree of high-frequency EMI control (via shields or whatever) in a monitor does NOT indicate how well it performs in these lower-frequency aspects.

> I keep my scanner sitting on the Sun with no hint of interference. The Mac
> depends on coated plastic and a couple of flimsy shield plates. It *is* a
> tight box though, as many people who have had them overheat will attest.

Are you talking about monitors here or the shielding of the "processor box" itself? With the Mac, these two aren't separable. Keeping a scanner "sitting on the Sun" without interference might not be the same as "sitting on the Sun's monitor" without interference. Also, "flimsy" is not a concern in "shield plates," assuming that they're not also structural parts. In addition, I'm not sure that I'd want to predict EMI performance based on a visual inspection; there have been a number of boxes in my experience which sure LOOKED good -

heavy metal boxes, etc. - but which were sure lousy on the range. As an additional example - I have recently come across a monitor design which uses no sheet metal at all, except around the video amplifier board (which is where all the nasty HF/VHF stuff happens), and did quite well in EMI checks. I'd tend to rely more on the manufacturer's certification (in absence of the ability to haul the thing out to a test range myself); if, for example, the manufacturer claims compliance with the new European (CISPR) "B" levels, it's a pretty quiet system.

1338. Meteor Scatter

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 19:33:22 UTC
From: tedwards@src.umd.edu
Message-ID: <1992Jul28.193322.24817@src.umd.edu>
Source record: 286702

Since we expect to get awesome Perseids this year, given the theoretical
return of Swift-Tuttle comet later in 1992, I was curious if anyone involved
with meteor scatter could email me some information on it.

We are equipped with high-gain yagis on 2m and 440 MHz on az-el mounts,
and can put out about 150 watts on 2m and 30 watts on 400 MHz.
Is it reasonable to do meteor scatter with this equipment?

I'm looking to put a dualband antenna on my car, and wonder what
people would recommend given the following constraints ...

Must handle > 45 W transmit
good efficient radiator at or near the horizon
not glass mounted
as much gain as possible
the shorter the better
low cost
black anodized finish preferred

I've heard that Larsen make good antennae ... what do people think
of Comet (and their new B series antennae)

>Or are you "interpreting" that "broadcasting" must mean
>"commercial one-way transmission"? (:-)

>|> So, until the rules are changed, let's try to abide by them.

>So when the situation changes - let's bring the rules
>in sync with it.

Many times it is helpful to consult this book I have (you have
to know the alphabet to use it) called the dictionary:

transmission, n. ... 4. The sending of modulated carrier waves
from a transmitter.

broadcast, v. -tr. 1. To transmit (a program) by radio or television.

Ergo(*), it would be VERY hard to explain how his "transmission"
is not "broadcasting".

But then maybe the definitions section of the rules makes a distinction.

1343. June 1992 Callbook Tapes Available

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 19:52:58 UTC
From: flloyd@sunburn.West.Sun.COM
Message-ID: <l7b9cqlNNad5@west.west.sun.com>
Source record: 286711

We have shipped approximately 9 tapes as of today and wish to thank those who have participated thus far. The new database contains some 30,000 new entries, last updated June 10, 1992. Now that we've fully ramped the project up, we still need a few more participants in order to break even on the costs.

If you'd like to get a copy of the latest FCC Callsign database, read on:

* * * The Summer `92 Callsign Project * * *

After much waiting and anticipation, the Summer update of the callsign database is IN. The latest dump contains 568023 callsign entries occupying 54 Megabytes of space.

We're currently in the process of making copies of the database for all those interested. In order to recover costs, we ask for a $20 contribution for each copy made. In addition, those receiving copies must supply the blank tape and pay for shipping both ways.

The preferred tape format is the QIC-150, 150 megabyte quarter inch cartridge. We can also write QIC 24 (60 Mb), Exabyte 8mm, and 1/2 inch/9track tapes. UNIX TAR format will be used unless otherwise specified.

(We can also do EBCDIC and/or dd if all you want is the raw data, e.g. no sample programs).

In addition to the callsign database, which is a 54 megabyte flat file, we'll also be supplying 'C' source code to programs which may be used to creates indices and perform fast (bsearch) lookups based on either callsign or name.

In addition, you get a copy of the source to a complete, working callsign server program. All source code was developed on a Sun, and is ANSI-C compliant.

If you'd like a copy of the above package, here's what you shoud do:

1. Prepare a self-addressed and postage prepaid return mailer containing your blank QIC-150 (preferred) tape.

2. Enclose a note indicating your name, address and any special handling or formatting instructions. Please also include your e-mail address if you want e-mail confirmation of your order.

3. Enclose a check for $20 payable to Fred Lloyd

4. Package the above and send via US Mail (or FedEx) to:

Fred Lloyd, AA7BQ
8215 E. Wood Drive
Scottsdale, AZ 85260

If your tape is QIC 150, QIC 24, or Exabyte, it will be processed
within 2 days of our receiving it. Other formats will be processed ASAP.
9track 1/2 inch tapes take a little more time since we don't have
a drive onsite.

Thanks,

-fred

Joe,

I have a new 92 Camry and an ALINCO DJ-F1T with a 12 volt/5 watt battery pack which I use from inside the car with a RubberDuckie antenna all the time although I did stick my arm though the window and key up the radio the first time before I tried it! ?;-) Anyhow, no problems. I also have an NEC P200 handheld cellular phone which I use with a RD antenna inside the car, too.

But perhaps I have just been lucky!

Good luck and 73 Rich G. KA2TMT

: >but chickened out. Can anyone tell me how bad the loss is on the
: >glass mounted types? A local ham said they're terrible.
:
: My experience is that they radiate equally poorly with the outside
: element present or not. The coax in the car does most of the radiating.
: Others have other opinions. Mine is to grab that drill and cut that
: hole.

My experience with the Avanti 2m on-glass antenna was very good.
About five years ago I had one and ran some extensive tests against a
roof-mounted 1/4-wave mag-mount. I found that the on-glass antenna
performed at least as well, and most of the time better than the
1/4-wave antenna. There was one problem....and it has to do with
humidity. The on-glass antenna starts to migrate away from the window
after a long time....which causes a mismatch to occur. I don't recall
how severe it was....but eventually the sticky tape on the inside
capacitor box has to be replaced.

So I wouldn't run off and drill that hole yet.....but, despite my
experience with the on-glass antenna, I'd still drill the hole if you
don't care about selling the car.

I sent a piece of mail to all members of the ALINCO users list I maintain.
If you didn't receive a short mailer from me about ONE HOPEDALE CENTER and
Tad, a new member to Alincos customer support, then you aren't on the users list.
I have had a few pieces of mail that I can't find a way back to. If you want to
be placed on the Alinco mailing list, or can't seem to see your name on it, send
me mail with a telephone number where you can be reached.

Three rejects include:

rsj@mathcs.emory.edu
jose@inqmind.bison.mb.cape.at.com
marcplummer@ftp.com.

For those of you whohave a computer, you can obtain online manuals for the
DR-590, DJ-560 or DJ-580. Mods are also available. Call ONE HOPEDALE CENTER
at 508-478-6969 from 7am to 9pm et. There have been problems over the last 3 weeks
with the BBS and all new equipment has been installed. Baud rates upto 9600 are
supported. I can usually be reached at this number after 9pm et should you want
to talk.

Feel free to pass any and all information along to servers or friends.

Regards to all.

Jay (KA1SNA)

I understand the trepidation, but I think it's unfounded.
Unless you own a 'Vette or classic car, I've never seen any
proof that punching a clean hole in the car for an NMO mount has
any bearing on the resale or trade in value.

An NMO mount installed through a properly punched (or drilled) hole
in a metal car is better then a windshield, gutter, or a magnetic mount.
I use a series of twist drills and a chassis punch to make the hole.

If you're really worried about it, put a cellular phone antenna on the
NMO mount before selling your car and advertise it as a selling point.

Throw down your Blue Book and pick up a drill :-)

No, he wants to be ready when VORs carry voice ID and commercials which
will pay for all the spiffy new FAA ATC computers.

Then again, he could want it so he can listen to VOR IDs now
and practice his Morris.

It has to be more fun than listening to cellular phone calls.

Hi,

I hope this is not an FAQ. I'm planning to buy a 430MHz TRX for Packet Radio, and thought it would be a good idea to see wich models are suitable for Packet Radio with 9600 Baud.

Especially, I would like to hear _any_ experiences with the following Rigs:

- Alinco DJ570
- Alinco 419E
- Kenwood TM441E
- Yaesu FT712RH
- Icom IC449E

Thanks in Advance,

Frieder

Thanks for the comments on the IC-2SRA, Glen.

Does anyone have any thoughts on how the wideband receive capabilities of the IC-W2A compare to that if the 2SRA? The 2SRA has the wideband receive and scanning features that I like, but the W2A is a dual-band radio, which I also want.

The 2SRA seems to have wideband coverage as a documented feature, whereas on the W2A, as far as I can tell it is a "keypad" mod to get the extended coverage.

Are there any other handhelds by any manufacturer that I should consider too?

Thanks,
John N1IPE

>Is this supposed to have anything that you can't get out of the ARRL
>repeater directory? Only $6.00, pocket size, lists more repeaters on
>more bands than I'll ever use.

Yes, the important detail that's different is that I want the location info in a form that someone who isn't familiar with the area can use: Longitude and Lattitude. For example, if you're in the southernmost part of San Jose, you're more likely to be able to use a repeater listed in Morgan Hill than one listed in San Jose. Yes, there is some hint to regions, but "South Bay" is a large area. And most residents of South San Francisco consider themselves part of a region called "The Peninsula" than part of the "South Bay". And there isn't such a region.

Of course, the ARRL gets their info (as far as I know) from NARCC (repeater council, norther half of CA), and NARCC has chosen to make these divisions, but they are fairly artificial. I'm hoping to build up enough of a database that one could do the query something like "I'm traveling from point A to point B, on a more-or-less straight line. What repeaters are likely to be useful?"

Other than the lon/lat info, most of the rest can be gleaned from the ARRL directory, which I have a (many, actually) copy of. I'm also collecting info on how to place emergency/911 style calls, if the trustee allows giving out that information freely.

>If you want something with the ability to get repeaters sorted by
>frequencey or call, i.e. database queries, have you asked ARRL about
>availability of their database for use by a server somewhere?

If this data _is_ online somewhere, I certainly haven't heard about it. On the other hand, I'd love to have it, if it's available.

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
.-
1. Printouts of Volunteer Examination session
opportunities in his/her area.
.-
2. Listings of Amateur Radio clubs in his location.
.-
3. Helpful promotional material about the Amateur Radio
Service.
.-
The already-licensed individual might well be interested
in another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely
points out how the ARRL National Traffic System and the
ARRL Amateur Radio Emergency Service function as a
cohesive unit to provide the maximum support to the public
both in times of disaster as well as "normal" times.
.-
To obtain either of these free ARRL services, please
provide me with:
.-
A. Your name
B. Your mailing address
C. A Specific request for either of the two services
above.
.-
Best 73!
.-

1356. Upcoming DXAC vote on the Balkan republics (ex-YU)

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 22:52:41 UTC
From: reisert@mast.enet.dec.com
Message-ID: <9207282252.AA27214@enet-gw.pa.dec.com>
Source record: 286717

Msg #386 From: KC1AG Date: 28-Jul 1744Z Subj: DXAC Vote on Balkan Republics

The following is a brief summary of a matter before the DXAC
for DXers in the New England Division. Comments are mine
alone. Everyone is welcome to read the note and send
comments to your ARRL Division's DXAC representative.

Croatia, Slovenia, Bosnia-Hercegovina, Macedonia, and the
reformed Yugoslavia:

A DXAC vote has been scheduled for August 24 on the DXCC
country status of the new Balkan republics and possibly on
the old Yugoslavia. While I have little doubt on the eventual
recommendation for the new republics, there is a plethora of
possible dates for DXCC credit, e.g., date of independence,
date of U.S. recognition, date of UN recognition, date of EC
recognition, etc. Furthermore, there is disagreement on just
what the independence dates of at least Slovenia and Croatia
actually are. No doubt the DXAC will soon learn what will be
on the ballot so I can inform you reliably on what it is that
we will be voting upon.

Regarding the possible deletion of the old Yugoslavia, I do not
believe YU will be deleted--in spite of the US move to require
the reformed country to reapply for admission to the UN. If
anyone has any comments on this point, please let me know.

The representative radio societies in the new republics
should be given an opportunity to make comments on whatever
dates for DXCC credit may eventually appear on the ballot. Not
extending our fellow amateurs in these new nations the
courtesy of making comments on the various possible dates
could engender ill will for no good reason and would reflect
poorly on the DXCC Awards Program and the ARRL. Unless the
chairman delays the vote and lets the committee know what
we will be voting on very quickly, it may be impossible to
extended this courtesy.

73 de Bill Shipp, KC1AG, NE Representative to the DXAC

1357. Upcoming DXAC vote on Abu-Ail

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 22:53:14 UTC
From: reisert@mast.enet.dec.com
Message-ID: <9207282253.AA27243@enet-gw.pa.dec.com>
Source record: 286718

Msg #384 From: KC1AG Date: 28-Jul 1539Z Subj: DXAC Vote on Abu-Ail

The following is a brief summary of a matter before the DXAC for DXers in the New England Division. Comments are mine alone. Everyone is welcome to read the note and send comments to me, but you should also send a copy to your ARRL Division's DXAC representative.

ABU-AIL

A vote on Abu Ail has been scheduled for August 24. Unfortunately, I have no precise idea of what the DXAC will be asked to vote upon. Dieter Loeffler DK9KD, president of European DX Foundation (EUDXF), presented evidence in the form of a short entry in a "Notice to Mariners" that Yemen has installed a light on Quoin Island, one of the several islands in the Abu Ail group. He maintains Yemen claims Abu Ail Island and Jab Al Tair, and that the remaining islands(?) are claimed by several other countries: Yemen, Ethiopia, Eritrea, and perhaps Djibouti. He states that nobody really wants these. DK9KD then draws a comparison between Abu Ail and the Spratly Islands: they are over administered, meaning that several nations claim the islands but no one occupies or controls all of them. DK9KD states it is not possible to obtain landing permission for the Yemen-controlled islands, and I gather no other country will issue landing permissions for islands they are alleged to claim.

The EUDXF acted as the licensing authority for Abu Ail when it was under control of the Red Sea Lights Company, and the EUDXF began assigning call signs beginning with the A15-prefix after talks with the DARC. It is uncertain just how the EUDXF (or the DARC) obtained this authority. EUDXF took over from the Djibouti S.A.R.L. when it went out of existence.

Insofar as I can find, over administration has never been actually used as a justification for retaining the Spratly Islands. However, it is a term that has found its way into DX vocabulary without any basis in written DXCC rules. (If you have documentation on this point, please let me know ASAP.)

Should the Yemen-controlled islands be deleted? There has been a change in administration or control, but perhaps not of all of the islands. Should the DXAC recommend another Spratly Islands be created with the name "Red Sea Islands"? Or should

the whole lot be deleted after the change in the administration of Abu-Ail, forcing any potential New Ones to meet the present criteria?

Efforts are underway to delay a vote until additional information is received, but there is reason to believe the chairman of the DXAC will proceed with the vote. Please send your comments and any information you have on the above to me ASAP. Thanks and 73.

Bill Shipp, KC1AG, NE Representative to the DXAC

1358. Re; ICOM IC-2SRA

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-28 23:43:29 UTC
From: roman@oakhill.sps.mot.com
Message-ID: <1992Jul28.234329.6312@oakhill.sps.mot.com>
Source record: 286631

Linda Stocks (AA6MR) asked about the IC-2SRA...I'll venture my opinions and welcome anyone else to comment so I'll know whether or not I'm 'off-base'.

I bought my IC-2SRA in January because I like to listen to military aircraft and 280-400 MHz is not easy to find on less expensive scanners. My only other radio is a Kenwood TH-27A which I picked because I really like its performance in the 118-136 MHz AM aircraft band.

The IC-2SRA user interface is NOT as intuitive, NOT as easy to work in the dark with one hand, NOT as easy to read in the light...but I'm sure you can learn to like it and without the TH-27A as a basis of comparison, I would probably never recognize these points as weaknesses. It is adequate.

The IC-2SRA DOES work well in the band of interest to me, as well as in the 460 MHz and 800 MHz public service bands. The antenna CANNOT be expected to perform well everywhere, but the radio is adequate in these bands with the antenna supplied (I am talking about the 2nd antenna; the one with the cheap phone jack for a connector.) The 2m receiver can also receive the 118-136 MHz aircraft band, apparently AM detection and AGC. It is not quite as good as the TH-27A, but not bad. The Wide-Band receiver is not as good as the 2m receiver in the 118-136 band, but I suspect that this is a result of the antenna more than anything else.

The literature I have says that the radio will receive 25-950 MHz, but it seems deaf outside 50-900MHz. (even though the synthesizer seems to lock properly from 25-950). I have found very few birdies that are bothersome, but (as you should expect) it is more prone to "intermod-type interferences". The TH-27A is much better in its ability to operate in areas where the pager transmitters are located. (but it is not perfect either...)

Audio quality is good, but you need a headphone/speaker mic in noisy environments...not much audio power. The battery life is reasonable compared to what I get from the TH-27A, but it does NOT have the Extra-Low power transmit that the TH-27A has and I find this a bit of a hindrance to extended battery life (I work and play within a couple of miles of 2 popular repeaters and EL power is fine for many occasions).

The knobs on the top are TOO, TOO close to the antenna and this makes using them a bit cumbersome.

The only serious complaint I have is that the radio sometimes interfers with itself when I try to scan with both receivers simultaneoulsy. THIS CAN BE A PROBLEM, but remember that the wideband receiver covers all of the frequencies that the 2m receiver covers, so it might be a nit-picking thing.

Summary - the radio works in the bands of interest to me, its resistance to intermod (etc) is not bad, all considered, but I could be in a good part of the country for the combination of this radio/interferring frequency allocation/receiver IF frequencies. The user interface is not great, but you could learn to like it. The feature set is GOOD, but lacks call alert which the TH-27A has and I like....The battery consumption seems O.K.,

I'd buy it again. I have NOT found any "holes" in the coverage from 25-950 MHz, other than the lack of sensitivity at the extreme ends.

I hope this helps...Good Luck.

>capacitor box has to be replaced.

I've had similarly excellent results with the Avanti antenna.
I currently have three. One of mine has been installed since I
bought my El Camino new in 79. I've done fairly extensive
testing of the 2 meter antenna vs a Larson 5/8 wave mag-mount.
Under most conditions the Avanti performed as well as the
Larson. The differences seemed to be as much a function of the
differences in radiation angle as anything.

The key to eliminating the problem you mentioned is to not use the
sticky tape. I believe the current antennas and the remount kits use
silicone RTV to mount the matchbox. In any event, I've used RTV
since the sticky tape came loose on my first Avanti in about 1980.

The only really critical thing is to accurately tune the matchbox.
The antenna does act like a dummy load if the tuning is even a little
bit off. Beg, borrow, or steal a Bird or equiv wattmeter and do it
right.

>
>Anyone else have similiar experiences??

Yep.

I bought one at local store here. It would work fine until you'd had it on for a few hours. Then it would go into a really slow scan mode. Every few seconds (inconsistant interval) it would jump up a frequency step. The tune knob stopped working too.

If I turned the thing off for the night, it would work fine the next morning... for a while.

I took it back to the Radio Shack I bought it at and they arranged for me to pick-up another one at a different local store (they didn't have any more in stock).

Didn't cost me anything other than a few minutes driving time and gas...

My new one is doing fine.

Source record: 286635

It is unfortunate you had problems with your HTX-202. I've had mine for about 4+ months and no problems. I also left my job at a Radio Shack about 4 weeks ago. AT the time I left, the repair manual was not available to the tech shops. (I backordered one for myself :-)

If your radio is still within it's original waranty period, I'd recommend getting the TSP, or extended warranty. This will give youa total of five years warranty. R.S. also seems to be more eager to please the customer when said customer has bought the warranty plan. For $39.95, it's a good deal. I have had no trouble leaving mine on 24 hours a day for the last few months as my packet radio...

** caveat on semi-related topic - don't buy the soft case now available. it's super cheap (construction wise) and even though it's only about $10, still not worth it...

1371. Digitized Music OK?

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 11:55:45 UTC
From: FBCABAC%CFRVM.BITNET@VTVM2.CC.VT.EDU
Message-ID: <9207291155.AA24111@ucsd.edu>
Source record: 286639

Some have suggested that if music is digitized first, then it is OK
to transmit (packet, RTTY, SSTV of sheet music, etc.). I've even
seen Wayne Green advocate this in "73 Amateur Radio". This would probably
be within the "spirit of the law" - that is, not the type of music we
hear on the FM broadcast band. Extending this logic further could lead
to trouble, though. For example, could I transmit business communications
if they were digitally encoded (perhaps in CW) first? Perhaps music
should be defined more explicitly in the next rewrite of the rules.

That's already been done - I read about it in one of the Ham mags a year
or two ago. It was done just to show that the rules need to be revisited
from time to time (nobody was cited for it, either).

Message-ID: <9207291255.AA27732@ucsd.edu>
Source record: 286643

In QST for July, W3EP discussed the possibility of a brief "storm" of meteors during this month's Perseids shower. This topic was also covered in several articles in Sky & Telescope.

Be aware that W3EP's article incorrectly placed the "storm" on August 12th. It ought to be on the 11th instead. Everything else in the article is fine, but the date is off by one day. There will still be plenty of meteors on the 12th, but the "storm" is expected on the 11th (same time as in the article).

This information is from W3EP himself, with apologies to those who might have been inconvenienced.

1375. ADDS Terminal Info Wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 13:06:45 UTC
From: LWRCLMR@strathost.stratcom.af.mil
Message-ID: <9207291306.AA28349@ucsd.edu>
Source record: 286645

I recently came into a dumb terminal made by Applied Digital Data Systems, model VPT A1, T/A 518-001018 (whatever T/A is). It also says ViewPoint on the keyboard. It appears to be a simple dumb terminal, has a printer port and RS-232 port on the back, the keyboard plugs in via a short cord that looks like a telephone handset cord. I was told it was operating at 300 baud, but should be changeable. There is an eight position DIP switch on the back.

What I need is what the DIP switch does, what the settings may be, i.e. baud, number of pits, parity, etc. Any possible terminal commands, such as clear screen, program of function keys, printer on/off, etc. And what terminal emulation it may be, VT-100, H-19, VT-52, etc.

Any help will be greatly appreciated. I would like to get this thing up on packet. Please E-mail responses as I don't always get this newsgroup or have time to read all the messages that come through.

Thanks and 73,

Michael, WA7SKG

A few years ago I was stunned to hear music comming from my Model 15 Teletype! I was in contact with a friend in RTTY when the bell on the teleprinter rang out 'Jingle Bells' (just before XMAS). It was in one tone but it was quite unmistakeable. (somehow I don't think it would be the same on an IBM pc)

I think the spirit of the regulation was to prevent people from pretending to be a broadcast station and competing with the real broadcast stations. I'd bet my reputation that the FCC doesn't care if you send digitized music or letters representing musical notes or digitized images of sheet music as long as the average Joe listening on his shortwave receiver can't hear the music.

John Mortimer is a writter and ex-barrister. He is the author of the
'Rumpole of the Bailey' series made by Themes TV (and shown on PBS here).

> Thanks,
> Linda, AA6MR

I've got one, and I like it a lot...it's handy for me to have a
2 meter HT that also can tune local broadcast FM stations, TV audio,
NOAA weather radio all in one package, as well as being able to function
as a general purpose scanner.

I have been a little disappointed with its HF receive capabilities,
and would like to know if this is typical, or if my unit has a problem...
it seems to have very little sensitivity below 50 MHz. I base this on the
fact that I live in an urban area, and have never heard anything below
this frequency on it...and there should be plenty of traffic between 25 MHz
and 50 Mhz here (eg, CB on 27 Mhz, cordless phones and baby monitors
at 49 Mhz). This is all done with the whip antenna - haven't tried with
an external one yet

I've been thinking of sending it in and having it checked out while
still under warrantty, but like it so much I don't wanna be without it
that long...so, I'd appreciate hearing if this performance is typical
or if I need work on mine

Hi,

Maybe a FAQ, but i've never seen info on this one.

I know there is a lot of ham-radio software for MSDOS systems
on several FTP-sites. But I was wondering if there are also
ftp-sites with ham-radio software for Apple Macintosh.
Is there a lot of ham software for the Mac, like MSDOS ??

Thanks in advance.

Jaap

|BUT I'm only 36 (as of today in fact) and I remember poking around on a
|galena crystal with a cats whisker on my first kit-built radio. Does
|this make me an oldster? :-(

I can't let this one slip by without comment ....
I built a cat's whisker radio at the age of 14 or so. I'm 24 now (and I
still haven't done anything about getting a license). What does that make
me? A junior oldster? :-)
In fairness I should add that the cat's whisker itself was pre-assembled
and was a beautiful brass-and-glass enclosed object. It belonged to my
grandfather who was a keen SWL and built a load of his own valve gear.
Sadly, he's long since dead - I inherited most of his stuff.

nit nit nit....

The restriction is there to prevent people from acting as the local broadcast station. Having the local headbanger station on in the background while talking probably is illegal if you want to split hairs, it is more just bad operating procedures. So is having a speech processor turned on so everyone can hear the tv set, kids, your spouse, and the neighbors dog in the background.

Music on hold? I guess that belongs in the current "Is it business" autopatch flames going on in another thread. Hint, most homes don't have music on hold.

Comp.dcom.telecom has an enormous volume of traffic even after moderation!
Pat, im my opinion, does a very good job in keeping the discussions to the point whilst allowing varying viewpoints to be expressed. From what I can tell, after about 4 years of reading that group, any the effect of 'moderation' is to discourage frivolus postings, ratbag postings, and repetative ramblings. I have seen no attempt to censor criticisms of the moderators work, from those who believe they have been aggrieved, indeed he seems to bend over backwards sometimes to be, and be seen to be, fair.

As you point out, there is the alt group for the dis-satisfied customer.

I use mine to listen to CHP in the 42mhz band- no problems. I've made my own antennas as the stock antenna is useless. Also, you can buy BNC to 1/8 connectors thereby allowing you to use your favorite antenna. I`ve also been able to recieve the new cordless phones in the 900 mhz band.

1394. VHF FM radio observation project, advice needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 16:44:44 UTC
From: dal3@cbnewsg.cb.att.com
Message-ID: <1992Jul29.164444.23994@cbfsb.cb.att.com>
Source record: 286654
Cross-posted to: sci.astro,rec.radio.shortwave,rec.radio.amateur.misc

I apologize for the cross-posts if inappropriate, but I don't usually read the radio groups & I'm sure some experience is out there. This continues a sporadic discussion of meteor shower observation using FM VHF radio, especially for the Perseid shower that peaks around Aug. 11, that has been going on in sci.astro. My radio questions come at the end.

I signed up to help with a middle school summer science program here at Bell Labs the week of 8/10, will conduct an experiment with 1 or 2 students, and decided that because of timing it would be more fun to do VHF FM observation of the Perseid meteor shower than to do some canned project. I have never tried this, so the chances for failure are unknown-to-great.

I went to Radio Shack last night & bought an antenna, mast, tripod, 300 ohm twin lead & misc. supplies, so the project budget comes in at around $55. I have a tuner. If the FM noise-to-meteor signal bounce proves to be clear & unamiguous, I hope to catch the sessions on cassette tape, run them through a Sun Sparc workstation audio input, and crunch them to at least show the occurance of meteor bounces (which we'll correlate with our ear observations), maybe even things like attack & decay rate if they're discernable.

The seeing was excellent last night (July 29 A.M.), so I decided to do visual observation of meteors along with trying out radio for first time. Andromeda galaxy was clearly visible to the naked eye, nice & big. Also it was the first time I found the Cassini division in Saturn's rings since I got my C8 last fall (12.5 mm eyepiece, 160X), so things were pretty good.

I was hoping for Delta Aquarids, saw 4 between 00:20 and 01:00 E.D.T. (I'm at 75 deg. 45 min. W long., 40 deg. 25 min. N lat.). First two were fast, bright, and thin, dropped about 10 deg. from western Aquarius straight down into Capricorn. Next one was a nice fireball, same speed but shorter path (5 deg.), flared twice, second time brighter, ended straight above Fomalhaut. Last one high in eastern Aqaurius, very short and dim, but headed parallel to others.

After 40 mins. some Perseids started coming so I switched my attention & may have missed a few Aquarids. First one blazed across the Great Square of Pegasus from berfore Alpheratz to Markab, brighter than the non-fireball Aquarids. That was about 1 AM. During the next 45 min. I saw one parallel to first in Pisces, slightly longer (15 deg.) & bright (around 1st mag.). One faint one near horizon/Perseus, harder to see, and another parallel one in Cassiopeia, so they came in at about same rate as Aquarids.

The concurrent nightime radio observations were ambiguous at best. I pointed the antenna to the respective radiants for Aquarids and Perseids as I watched. It was almost impossible to find good clean hiss at night, so I settled for mixes of stations. There were a few occasions where other stations would fade in briefly for a second or two, other times when there would be long, slow fades from one dominant station to another, but nothing bursty or loud. There was no correlation with the visual meteors, but I expect that radio meteors will be over the horizon.

I tried again between 9 and 10 AM EDT, pointing the antenna NW for Perseids, & got some results that I don't understand. I was able to find some clean white noise/constant hiss below 91 MHZ. (August Sky & Telescope recommends 88 to 91 MHZ for this), but occasionally the hiss' amplitude would start to pulse, starting out around 10-20 times a second, taking up to 10 seconds to drop to a period of 1-2 seconds. ALWAYS at this point I would hear a radio station for a fraction of a second to a few seconds, usually faint, but some times booming. The vanilla hiss would return. At 10 AM a station came on & I quit.

There were about 25 of these from 9 to 10 EDT (I was eating & didn't keep accurate count, my 6 yr. old daughter was VERY interested & stayed by the radio). I couldn't account for the leading noise amplitude pulsations, & when I first heard them I figured that they were cars coming to a stop somewhere. But the pulsing was lower frequency than car ignition noises I've heard, slowed in frequency very gradually, and was ALWAYS followed by reception of a radio station for a short time. IS THIS IT? I'd deparately like to do this experiment with these students, but I have to be careful not to do something that bombs & leaves them with a bad impression. I'd appreciate any advice.
Please email me direct as well as posting a response, since I don't get to the radio groups regularly. Despite being KB3AB, I've never gotten a ham station, and my radio theory is about 15 yrs. old & rusty.
Thanks.

I also found the following title in the Bell Labs library system, haven't got the book yet, but it should be useful for anybody trying this out:

Meteor burst communications / Jacob Z. Schanker

I don't know how much there is available, but there is one I know of.
For using packet/TCPIP on the mac, you can get NET/Mac.
Ftp to ucsd.edu, then cd to hamradio/packet/tcpip/pa2aga and get the
software there. (From Adam, pa2aga).

This is the only one I know of, so you might ask around some more.

So the people who wish(ed) to use the CW requirement as a "filter",
presumably would rather have the 7 year-old who can't pass the Tech,
rather than the adult engineer who hasn't mastered morris...

Just out of interest, how common is the following scenario :-

1. Kid is interested in radios, gets licence.
<few years pass>
2. Teen is more interested in dating, going to the pub, cars or whatever.
<few more years pass without much radio stuff, if any at all>
3. Adult gets back into radio.

It's during the last phase that they can contribute most to the
hobby...

Of course, some slackers skip steps 1 & 2 :-)...

>from time to time (nobody was cited for it, either).

Just because no one got cited doesn't mean it is ok. I seem to remember
driving above the speed limit once, and didn't get cited.

But, let's be serious here. The no music rule was first added to part 97
back in the early days of voice radio. Back then test equipment was
scarce, and so were helpful assistants, so a common way of testing your AM
transmitter was to hook up the record player, and aim it at the microphone
and listen while you fiddled with modulators, etc. for the best sound.

Well, when commercial broadcasting of music started to become popular, a
curious thing happened among the amateurs, seems that they spent all of their
time testing their AM transmitters :-).

Somewhere in this time period, the FCC split the radio users into those who
wanted to communicate, and those who wanted to broadcast. When they did this,
they created an amateur communication type of license (but omitted an amateur
broadcasting license, hmm?). The rules describing this service specifically
forbid amateurs from broadcasting (eg. non 2-way), and specifically forbid
music.

I suspect that these rules were put in to placate the commercial broadcasters,
who would lose audience to the amateur broadcasters. Remember the golden rule?
... He who has the gold rules!

Please note that the above is just the essence of what happened. I am not old
enough to have lived thru the period, and I am not a historian, I just remember
roughly what happened. (from a variety of accounts of the period.)

1399. G.E. MVP to a Repeater (Instructions)

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 17:29:57 UTC
From: billp@niagara.Tymnet.COM
Message-ID: <2163@tymix.Tymnet.COM>
Source record: 286656

I know nobody asked but I did this for someone else and I thought it would be nice to share the information. A lot of clubs these days have a need for a new repeater and what with the economic thing don't have a lot of money to spend. There is a lot of junk being marketed as ham repeaters (i.e. Spectrum Communications) for horrendous prices. I thought it would be nice for people to have the choice to do the Ham thing and save a bunch of money.

These radios are available all over the place for very modest prices and make great repeaters. They work on our California mountain tops without being fried by the other R.F. around. Better yet they are a good neighbor. They put out power on just one frequency at a time and the receivers are selective enough to work on 12.5 Khz split channels (though most Japanise portable radios wont). The transmitters are very clean if tuned up according to G.E. instructions. Transmitter tuning only requires a wattmeter, dummy load and a VOM. I have tuned the receivers up with just a weak signal on channel but I do recommend a signal generator. The MVP's will put out ~60% of it's rated power (there are several models ranging from 5-35 watts) continuous duty. This isn't a lot of power but at least when you add an power amp to it the amp won't be multiplying garbage.

P.S. No I don't work for a company that sells MVP's nor am I interested in duplexing any more for other people. I really love these little puppies and I have them running all over the place but I've done 20 or so and I'm not as young as I use to be. :)

---------- Cut ? ----------

Instructions for Duplexing a G.E. MVP
by Bill Putney
WB6RFW

These instructions will work for MVP's on any band.

Before you start, test the radio completely to establish a benchmark for post conversion testing. It is better to find any problems that exist in the basic radio and fix them now. After the conversion you only need to find the problems you created.

MVP C.G. encoder/decoders are pretty useless after the radio has been duplexed so now is a good time to get rid of it. Don't forget to replace the resistor between H1 and H2 on the System-

Audio-Squelch board (The SAS Board). Most of the duplexing is done on the SAS board.

1) Remove the SAS board from the radio.

2) Cut the printed circuit land that connects J904 pin 2 to U902 pin 7. The best place I've found to do this is right near U902 pin 7 on the solder side of the board. There is a land that goes from U902 pin 7 to a via pad. This trace is only about 1/8" long and is shown in gray in the MVP manual Outline Diagram. I use an Exacto knife to make these cuts. Make two cuts perpendicular to the run of the land about 1/16" apart then remove the land in between by prying up one end and pealing the copper away. This disconnects the receiver oscillator control line so that the U902 no longer can turn the oscillator off during transmit.

3) Place a jumper between J904 pin 1 and pin 2. I do that right at J904 on the solder side of the board. This puts regulated 10V back to the receiver osc. control line so that the oscillator is always enabled.

4) The next cut is a little harder to find. The line on the schematic that connects the junction of CR901, U902 pin 6, and J906 pin 5 to the junction of R905, R906 CR905, C906 and U901 pin 7. On the schematic it's a nice straight vertical line just above U902 but on the board it runs all over the place in and out of via's, from the solder side to the component side and back again. The place I cut it is on the component side of the board near J905. Set the SAS board on the bench with the component side up and the board oriented as shown in the MVP Manual Outline Diagram. On the Outline diagram you can see two component side lands that run parallel along the bottom edge of the board the whole length of J905. The bottom most land connects H16 to J906 pin 4. Don't cut this one... The one you want is the next one up. It kind of looks like and S on the board and runs between J906 pin 5 and a via just below U902 (next to H5). I make the cut near the end (pin 7 end) of J905 before it makes a turn and goes up toward U902. Make the cut as described in 2) above.

5) All of the I/O lines to the radio can be found on the SAS board and should be connected before you put the board back in the radio.

PTT is at H17. This is a ground to transmit line.

COS is at J912. This line is ~0.1V when the radio is squelched and ~9.0V unsquelched. Don't try to run a relay from this COS line. I'd use a CMOS gate to buffer it. If you're useing a modern controller chances are that it uses COMS logic and the buffer isn't required.

Mike in is at J913. This line has mic bias on it and should be capacitor isolated. It takes about 2V P-P to drive the radio to 4.5 Khz deviation.

Receiver audio is found at H16. This is unprocessed audio. It is not squelch gated and is not de-emphasized. There is ~4V P-P with 4 Khz deviation on an on frequency signal applied to the receiver. This should not be loaded by less than a 10K input.

6) Put the SAS board back into the radio.

7) Unscrew and unsolder the SO-239 antenna connector and remove it. (If this is a UHF radio I'd throw it away and get an N connector but it's up to you). After the conversion this will be the transmit antenna connector.

8) Unsolder and disconnect the coaxial jumper at H2 on the Filter board. Disconnect P1 (this is the antenna relay control and can be cut off and pulled out of the harness or left alone. It won't do much when you're through).

9) Remove the filter board from the radio.

10) Using solder wick remove as much solder from around the antenna relay can on the component side of the board as possible. Also use solder wick to remove as much solder as possible from the relay pins on the solder side of the board. If you can remove enough solder from around the pins you can break them lose with a small screwdriver of knife when the solder is cold. This will make the relay easier to remove. With a small pair of diagonal cutters grab a corner of the relay can. Using the soldering iron, heat whatever is stuck and remove the relay.

11) Now you need to remake the connection between the output filter and the antenna connector. I use a piece of center conductor from a piece of RG-58 to do this in the hopes that the dielectric and the conductor diameter will keep the impedance about right. This jumper should be placed as close as possible to the circuit board in the holes left by pin 4 and pin 7 of the relay.

12) Now you need to rig up an antenna connector for the receiver. THE MOST IMPORTANT THING HERE IS TO HAVE A CABLE WITH A CONTINUOUS SHIELD from the receiver connector on the front end casting to the antenna connector. This means no voids in the shield around the connectors at each end. If there are unshielded parts of this assembly the receiver will hear the transmitter and the resulting desense will be unacceptable. Use a good quality connector like a BCN or TNC (or type N if you can make it fit...). I like all of the connectors to come out the back of the radio. This is real handy from the point of view of working on the radio later and looks real nice but is a pain to do.

If you chose to do this (or put an accessory connector on the back panel of the radio) you need to take all the boards out of the radio and mask off the back of the radio from the rest with newspaper and masking tape to keep drill filings from getting into every nook in the sheet metal and causing problems later.

Mount the connector as close to the edge of the cover opening as you can or it will hit the filter board when you put it back in. Make sure whatever connector and coaxial you use for this will make the turn to miss the filter can. You could mount all this stuff on the front (plastic panel) and save yourself a lot of work but it wouldn't look as nice and it only takes time to do it right.

13) If you choose to put an accessory connector on the back panel I suggest you put it near all the other connectors. To make room for this you will need to remove the little sheet metal doodad G.E. decided to put on the back of the radio. Don't forget to mask off the power connector especially around the base where it meets the back panel of the radio. Metal filings like this way of getting into the radio.

The doodad is held by two spot welds.If you look carefully you can see where they are. Drill these down to the point where the drill is just getting into the back panel. Be careful not to screw up the power connector in the process.

I put the accessory connector next to the power connector. I like 9 pin D type connectors. They are widely available and of good quality. The D shape makes them a pain to mount without a punch (the Greenlee punch for this is >$280.00). Get the connector as close to the edge of the cover cutout as you can. This keeps it up high in the exciter area

and out of the way. You are working through two layers of sheet metal so be careful when (if) you tap the mounting holes as the tap tends to bind between the layers. Put the radio all back together now.

14) Put the output filter board back in and solder the transmitter antenna connector back to the tab on the filter board.

15) Retest the radio to make sure it survived the operation.

That's all it takes to make a $100-$200 MVP nearly as good a duplexed radio as a $1,000-$2,000 MSTR II base station!

1400. Cushcraft R7 Installation

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 17:41:40 UTC
From: n2gj@phsbbs.princeton.nj.us
Message-ID: <6NPooB2w164w@phsbbs.princeton.nj.us>
Source record: 286595

Just finished installing the new Cushcraft R7 antenna (40-10 including WARC bands) on a 20 foot aluminum mast at N2GJ. The assembly was a breeze (though we were short a couple of stainless steel screws - one of us has a fabulous junque box, though) taking about an hour. The directions are very clear, with lots of pictures. The mast is attached to the side of the house with a Radio Shack 12" antenna mount kit (~$12.00) and we used RG-8X feedline. The MFJ SWR Analyzer shows nominal SWR on all intended bands plus ~2:1 on 75!

The first station worked was UZ1AWX, Art, in St. Petersburg, in the former Soviet Union, on 14.010, CW with the Kenwood TS-440/AT at 100 watts. RST was 579. Several other on-the-air tests confirm good matches on all bands. A brief test on 75 yielded "acceptable SWR" reading but poor performance compared to the G5RV at 45' which is expected. After all, the antenna is not REALLY designed to work there!

If anyone is interested, I will post other reports on this antenna, as I gain more experience with it. The best part? My wife, Connie, N2ATJ, helped with the installation and says "It's cute!" 73,

1401. Re: Soliciting Comments on Kenwood 520S XCVR

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 17:43:51 UTC
From: ham@wam.umd.edu
Message-ID: <1992Jul29.174351.27072@wam.umd.edu>
Source record: 286660

As far as a radio goes, there are several pluses and minuses to the 520S:

Minuses first:

- Broad receiver, unless you have the filters (optional = $$$), at least for CW.

- No WARC-band capability.

- Analog tuner, digital readout extra.

- Very much designed for NON-PORTABLE use - truly made for 120/220 AC use. (Although 12V power cable can be had).

- Weighs in between 40-50 lbs.

- No general coverage receiver (although will receive WWV on 15 MHz).

- No AM or FM mode, either on receive or transmit.

- Must be tuned on frequency whenever large frequency change is made.

- Tube finals are about $15 a pop (2 6146-B's + 12BY7A driver).

- No 2nd VFO internally.

- No notch filter.

Seems like a lot, doesn't it, compared to a $750 Icom 735. But wait:

Pluses:

- Nearly entirely discrete components, can be serviced by nearly anyone.

- No EPROMs to store program (and lose it when battery fails).

- One of the best-sounding signals ANYWHERE (supposedly due to tube finals).

- Tube finals (both + and -), because they can handle incredibly bad mis-matches that would quickly kill a set of transistor finals.

- Pretty good noise blanker.

- Simple to operate (except for tuning up).

- Virtually INDESTRUCTIBLE! This is not a joke!

Recap:

The Kenwood TS-520S is a 1975 design. It lacks a general coverage RCVR, sophisticated filtering, a second VFO, and many of the bells and whistles

that most rigs made after 1985 had as standard equipment. It is very much primitive compared to the stuff coming out today.

So why buy one, you may ask? The thing is built like a brick s--thouse. Mostly metal, except for the knobs and dials, a solid steel chassis, excellent reliability, and ease of repair. It is a very solid radio, if you can do without all of the bells and whistles. Excellent for STANDARD ham communications (WARC would be nice, though).

You can get one at a hamfest for $350 including mike and speaker (no filters), and you can get a tuner for about $75, give or take a few, depending on the make and model. Throw in a vertical for $50-75 and you're up to $475-500. If the rig has filters, or an external VFO, add accordingly. You will have this rig for a long time, so be sure you can do without the bells & whistles you would get for another $350.

Good luck, 73

Scott NF3I

1402. Need info about QSL card companies

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 17:53:00 UTC

Message-ID: <29JUL199213530653@venus.lerc.nasa.gov>
Source record: 286661

Hello all,

The amateur radio club here at NASA-Lewis Research Center is in the process of creating new QSL cards. Our old one is a black-and-white picture but we want a new one using color pictures that will give whoever who receives it an idea of what NASA-Lewis does.

Therefore I would like to get information about the QSL card manufacturer that your company or local ham club uses. A few things I would to mention:
1) We would be ordering 1000 or more cards for our first order.
2) We need someone who does custom work and accepts color pictures since the QSL card will either be one full color picture or a collage of 3 pictures.

Any info, name, prices, your personal views, reliability, etc about the company is also welcome.

Thanks in advance.

Source record: 286657

Hmm.... Once again an incorrect answer from an RS person.

The PRO-43 DOES cover the 6m band.

Freqs available (unmodified) in Mhz

30 - 54
118 - 174
220 - 512
806 - 823.9375
851 - 868.9375
896 - 999.9875

I'm reading those numbers directly from the back of my PRO-43.

Some people are becoming so stressed about the release of one RS product (the PRO-43).

I don't believe the PRO-43 was intended to compete with the Icom's or the AOR1000XLT(?). It just simply what the PRO-37 should of been, just a little late.....

A couple of QRP ARCI members plan to start an SSB QRP net of some sort. The "first pass" will be this Saturday at 1900 UTC on or about 28.322. Max, KA9JKK and Clark, WA3JPG will be there to start.

This is NOT an exclusive QRP activity. ALL amateurs of good will are invited. The subjects we would like to discuss are all facets of low power operation, especially low power radio design, antenna design and practice, and fun propogation. We will, of course, have fun lying about our QRP conquests, trying to outdo each other....if our egoes are threatened (hi hi).

If you are so inclined, give us a try using as low power as your transmitter allows....and if that doesn't work, crank it up until we all can hear you, if the 10 meter spirits are with us!

>the Kenwood compare?

Hi Mike:

I have owned a TS 520S, a TS 530S, and presently own a TS 520 (no "S") and am about to sell my 530S. They are all VERY SOLID and reliable radios. The receivers are quite good, but nothing special...just solid, stable transceivers. I like them a lot. I will keep my 520 going for some time to come, I'm sure.

Just a note, $600 for a 520S is a bit high, unless the mike and antenna tuner are real wonderful items. I would expect to pay $300-400 for a good running 520S, another $25 for a decent mike, another $50 for an MFJ tuner, and the HF6V (I'm not really sure about this antenna) for around $60 depending on its age and condition. That totals up to a range of $450-$550 for items in good working condition. Of course, if the items are really what you want, go for it. I don't think you will be disappointed, unless you want no-tune transistor finals.... the tubes in the finals of the 520 series are a different animal, with a few advantages and some real disadvantages. If you are not a super fast QSY type of guy, and you don't work a lot of fast break in CW, you won't miss the transistors. One word of advice: get a service manual and pick up a few spare tubes (a 12BY7A and a pair of 6146B's).

Good luck,

Clark WA3JPG

Hmmm I always thought it was LEFT sideband & RIGHT sideband :-)
After all there is a RIGHT sideband and a WRONG sideband. And we all
know what the 'wrong' sideband sounds like :-)

(I'm not even going to bother with a sig for this one :-)

1412. data compression with packet: legal?

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 19:51:20 UTC
From: jim@n5ial.chi.il.us
Message-ID: <1992Jul29.195120.9189@hou.amoco.com>
Source record: 286587
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

this may belong in .policy, but since there are also technical concerns,
I'll start here.

let's say someone wanted to setup something on packet (more likely on
HF packet) to use data compression between two stations. note, I did
NOT say encryption....just data compression.

first, would this be legal? my immediate guess is that it would be,
but that it's probably worth asking the question.

second, there are obviously lots of technical concerns. the type of
system I'm kinda thinking about would be an error-control/data compression
scheme very much like that used with modems (V.42/V.42bis, for example).
naturally, it isn't as simple as that with packet, but....

assuming that everything uses KISS, and that it is possible to enforce
the block size/PACLEN settings such that no data block ever gets split
into two packets, does this sound like a good thing?

of course, if you don't split the data block between packets, you really
don't need extra error control...just something to make sure that packets
don't get lost somewhere along the way. QUESTION: AX.25 already does
this this, right?

next question: does anyone know where I could find a very good, very
detailed description of the KISS protocol? how about AX.25? (or can I
just get the specs for X.25 and then get some diffs?)

any info appreciated....

I agree. Too often, though, people come in and say that the rules do say something is legal (or illegal) when in fact the rules do not deal with it at all, one way or the other.

It is generally accepted by many that "if it is not prohibited specifically then it is OK". For the most part I agree with this. But please let's not have people who want to operate, or encourage others to operate, under this concept, to disguise it in any way.

Sometimes a better answer might be: "the rules do not directly address the issue so you have to figure it out yourself, but I follow the principle that if it's not prohibited, then it is OK until they tell you otherwise".

The cases that fall out of this are where something is indeed prohibited such as "music" but that the rules are vague and it is not clear whether the wording means something broad or something narrow. In this case you have to use other things, such as figuring out the spirit of the rules.

So in the case of music, I still hold that the rules "may literally prohibit any kind of music because the prohibition is not qualified at all, but that the spirit of the purpose is to prevent the broadcasting of music for the purpose of entertainment". So go ahead and transfer digitized sheet music images ...I see no problem with it... but please don't go around saying

that the rules do not prohibit it.

Maybe the rules need some rewording (though the FCC has refused to make changes as suggested in the past).

>Others have other opinions. Mine is to grab that drill and cut that
>hole.

A third alternative is to use the car radio antenna. I built a
relay box with a matching network built in for each of 3 ham bands
(144/220/440 MHz). The relays switch in the proper network automatically
when you change bands on the radio. (TTL outputs available on the
rig, a Drake UV-3). When you turn the ham rig off, the antenna
switches back to AM/FM broadcast.

The radio is mounted in the trunk next to the antenna, and the control
head is in the glove box. With the glove box door closed, there is
no visible evidence of a 2-way radio in the car.

>IT DOES WORK!!!!! I JUST USED IT LAST WEEK!!!!!
>
>Tom WB9RXJ

OK. I will clarify. ICOM has decided to replace a direct dial phone number
in which you get a busy signal and pay no toll when it is busy, or get just
ringing when the staff is occupied and pay no toll when so, with...

...a voice menu answering system which:

1. If the line is busy, you just paid a long distance toll to find
out about it EACH AND EVERY TIME.

2. If the staff cannot answer, you are paying a long distance toll
to sit there and listing to the ringback sound for aas long as
your patience lasts.

3. If there is a busy, the voice menu system does give you the option
of leaving a message. I've left 2 messages and never gotten a call
back.

I label this setup as "Customer DIS-service" so that is why I say there
is no customer service number: there is no number from which I have yet
received any service since they installed the damned machine.

BTW, one of the 2 messages left was left with the secretary who answered
the main office number. She was unable, or unwilling, or not permitted,
to connect me to the phone line to which the machine connects (e.g. bypassing
the machine). Not that I would want that, since the toll charges were
already being accumulated with a call to the main number.

Solutions:

1. Eliminate the voice menu machine.

2. Take repair/tech service off the machine (if it is used for other stuff).

3. Publish the direct bypass number (in ads and on machine) to which a busy
or no answer condition does not result in toll charges.

4. Put this on an 800 number.

5. Make sure the number cannot ever be busy or not answered (probably
the least practical solution).

ICOM has my name and number (or at least they had the opportunity to keep it)
and can call me back when they feel like dealing with my questions, or want
to inform me that they have taken corrective actions. If ICOM believes they
have made a correction, I am willing to try again. But I must have some sort
of indication that indeed something has really been done, as opposed to simply
trying to get me to try again.

Several years ago Kenwood pulled this same crap. I tried many times to reach
the repair department. They even had the same machine on the main number so
it was not possible to reach even a real person anywhere there. That is why
I sold off my Kenwood gear and went with Icom. If some other company proves
to have better service and a good product line, I'll switch again. Until
then I am forced to operate as if no real customer service exists.

Nancy Rabel (KC4IYD) asks:

> ... I would like to get information about the QSL card
> manufacturer that your company or local ham club uses ...
> 1) We would be ordering 1000 or more cards for our first order.
> 2) We need someone who does custom work and accepts color pictures
>
> Any info, name, prices, your personal views, reliability, etc
> about the company is also welcome.

This info may not help you, but what I say below worked for me:

I have been using a printing shop in Japan, which does exactly what you want. The name of the place is:

Onoue Insatsu
5311-1 Hirose-cho, Shimosuwa, Suwa-gun, Nagano 393, Japan

They charge 12,000 yen for the first 1,000 cards plus 1,500 yen for shipping within Japan. This is about 108 dollars for 1,000 cards.

I've ordered my personal QSL card (for N6UOK) here, and also my club stations card (for W6YX). I paid 60,300 yen for 5,000 cards (that's 9.7 cents per card) when I ordered cards for my club station. I had people hand-carry some of the cards to California, so I did save on shipping.

This company has proved fast, reliable, and low-cost. I got the cards one week after placing my order. No mistakes (although the instructions were rather detailed), and good quality, too.

If you know somebody in Japan who can help you, maybe this will work out.

I'm looking to put a dualband antenna on my car, and wonder what people would recommend given the following constraints ...

Must handle > 45 W transmit
good efficient radiator at or near the horizon
not glass mounted
as much gain as possible
the shorter the better
low cost
black anodized finish preferred

I have used an Austin 500C with great results for several years. It meets all your requirements (except it isn't anodized, it is still black).

In simple A/B comparison with a Larsen 2/70 about twice its physical size I found it a tad weak in 2m performance and much better in 440.

Physically it looks like the cellular antennas with the thick part below the piggly-wiggly except the top part on the 500c is straight. I think he was the one who designed those cell phone antennas in the first place so the design is similar.

I have a Regency BTH-201B VHF transceiver. This is an early 70's radio. It is crystal controlled and has one TX/RX pair for 151.805 Mhz simplex. Does anyone know where I can get a manual and/or alignment instructions for this radio? I would like put crystals in it for the 2m amateur band.

I am also considering converting it to 2 or 3 channels. Is it feasible to do this by adding a simple selector switch (one for TX and one for RX) to choose the crystal used or is there more to it?

1421. User,s report on the *MULE*

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-29 22:05:16 UTC
From: Don_R._Moberly.El_Segundo@xerox.COM
Message-ID: <"29-Jul-92.15:03:50".*.Don_R._Moberly.El_Segundo@Xerox.com>
Source record: 286583

EXCERPT FROM THE *MULE* ADVERTISEMENT

The Multi-Use Link Enhancer, or *MULE* for short is manufactured by Link Plus in Columbia Maryland. It is a stand alone, half duplex LINK_PLUS unit that can be quickly connected to any radio with external cables.

The technology used in the *MULE uses digital signal processing to greatly improve the "Quality of a radio link". Linkcompex is an acronym for LINKed COMPressor-EXpander. LINK-PLUS works as follows.

At the transmitter, audio band signals are digitaly processed by LINK-PLUS to generate a fade-resistant control tone that is slaved to the audio wave form amplitude, compress the audio waveform and produce a signal that has a constant amplitude. The composit signal, consisting of the control tone and the compressed audio signal, is then transmitted.
At the receiver, the composit signal is processed in reverse. The LINK-PLUS circuity decodes the control tone and expands the audio waveform amplitude to original speech level. This reverse processing cancels out interference and noise picked up during transmission (by slaving the interference to the original spoken voice waveform) and delivers a significantly strengthened signal. The result is an audio signal that often exceeds that of the best wire and fiber optics communication systems.

In addition to the technology described above, the LINK-PLUS module has several unique features that also significantly iimprove the quality of radio communication. LINK-PLUS has an automatic calibrattion function which automaticly adjusts for frequency drift in single sideband systems. It also has an autosilence function that automticly maintains between keyed transmissions or pauses in speach. It also incorporates a bypass feature that automaticly switches of the Lincompex signal processing whenever a signal is received that has no control tone. This permits radios equipped with the *MULE to communicate with non *MULE* equipped stations and vice versa.

Although the *MULE* uses digital signal processing internally, signals entering and leaving the unit are analog. Connections to the *MULE* are made to the speaker and mic input/output, thru cables supplied by LINK-PLUS. LINK_PLUS also supplies a high quality speaker and microphone with the *MULE*.

END OF EXCERPT

After operating one of the units for over a month now I feel that I can give a first impression of the unit. The *MULE* does do all the things that the company claims it can do. The single problem I had with the unit was after taking it out of the shipping box and statring to hook it to my rig, I found three color coded RCA type plugs too hook up, but they were not identified in the book nor on the connector. Well a VOM solved that problem in a hurry.

I have been able to establish linked contacts with units in Maryland, Rochester New York, Hawaii, and Apple Valley CA. I have used them on HF as well as V/Uhf in the sideband mode. I have had three and four way links going on 20 meters. My conclusions are that the *MULE* realy shines on HF sideband. It is realy great to have a two hour QSO between Hawaii and California and not have to listen to the din of tuner uppers, the monkey chatter and all the other clutter.

The *MULE* works so well at removing the noise and garbage on the HF bands you will have the feeling that you are using a local two meter repeater but one that has better voice quality. The *MULE in the autosilence mode actualy cuts out the noise between sylables of speach. Can you imagine operating CW on 40 or 20 meters and have no noise between dots and dashes. The *MULE* can do this for you. Using one of these units for RTTY or packet will eliminate all the retries caused by QRM or QRN.

I have not been able to make any labortory type measurements to see if it meets all the specs. But I have made a lot of tests comparing the compressor on and off and the linked signal versis raw copy without the *MULE*. The compressor just by it`s self will boost youir signal 2 to 3 "s" units making the difference in whether the other station can copy or not even hear you.

The compressor is of the syllabic-rate type and realy does a much better job then the hard limiters you find on most of the ham gear. It does not induce distortion as the hard limiters do. Your signal just simply comes up out of the noise when you turn on the compressor.

If you are lucky enough to have another *MULE* on the other end of your QSO you are in for a real treat, with clear distortion free, noise free copy.

In general I would have to say that the unit meets all that I expected from reading the ads, and far exceeds what I expected in the HF operation. The next experiment I want to do is link to another *MULE* thru AO13.

If you have a chance to use a *MULE* dont pass it up, The only problem with using one is that it is so easy to get hooked on it. So try it with caution.

If you wish more information on the *MULE* you can reach LINK-PLUS at (301) 982 1585 ask for Doug Tucker and tell him Don WB6LFC recommended the unit to you. Or you can reach me at (310)333 7389 if you would like to set up a sked or more information.

I would like very much to see this become a standard feature on the ham rigs put out by the big three and with enough of us getting togather and using this mode and insisting that they offer it as at least a plug-in option on their mid and hi end units we will not be happy with them.

This passing off of switched capicitor filtering as digital signal processing and over charging what is worth can be swapped out for true DSP with all it`s programability for very little difference in cost.

Wouldn't it be great to have a rig like the TS950, or FT767 that had a built in packet modem, digital signal filtering for both voice and data, be able to set your own parameters for the voice you are listening to and be able to filter

out all the KW tuner uppers, and filter out the LID 100kHz away over driving his "linear" by 500%, that is splattering all across the band. The techonoligy in the *MULE* today is a long way down the road to being able to do just that and a lot more.

Even though I sound like a stock holder in the company, I have no affilliation with LINK-PLUS other than being a very satisfied user of their product.

This describes me exactly. In fact, it was during my wild years of no-radio that I missed getting a custom 1X2 call. My old crosstown CW ragchew buddy, WA7LDZ, paid attention and now he's W7SW. Annoyed at myself, I'm keeping my original call forever, or at least until I can get a single letter in front of the number like the no-codes get.

Ok, I have always had a mechanism for permanently hiding entries (10% of them
are permanently hidden). I indicate that entries can be removed by complaint,
but I guess I have been lax in suggesting in the list's header that I am
willing to permanently unlist entries. Anyone out there want their entry
hidden?

>2) The listed adress is anything reasonable.
Oooooh, there are so many addresses that are unaddressible from somewhere
in this network. I'd hate to remove an entry that was placed due to
a carefully set up From: or Reply-To: header line just because I could
not access them :-) :-)

Seriously, I send reply mail to all who update the entries and will
remove them if I get a bounce (rare 2 in 9 months) and can not contact
the postmaster at the site. Entries that come from the news postings, I do
not confirm as that would make ME the `Mother Of All Junk Mailers'.
The list is made to reduce noise on rec.radio.amateur.misc, I will
NOT increase noise by mailing to the 3000 odd entries I have in my
copy of the list. But, enough hate mail on that point and I WILL
change my mind :-}

>Basically any address more than 6 months old is suspect, and any more than
>a year or two old is probably marginal at best.
I agree, so far no entry is older than 9 months. I have not written any
automatic software to modify the date in place for articles flowing in
r.r.a.m except for a periodic manual `bump' by me. Once that is in place, I
can then confidently put in automatic software to remove entries that
are old. In time, it will come, if necessity gravitates me towards it :-).

I still have to iron out all the bugs in the sorting and automatic
entry software before I can trust it to read from the news articles.
Manual entry still works for me (along the same note, I still can not
trust a car with a computer controlled ignition timing, I went through
3 engines and 2 starters in my Sable due to the computer getting it
30 degrees wrong!!! :-{).

I am not comfortable with sending e-mail to all entrants that are about to
be expired, I'd prefer to silently cut them off after 9 months ...

Send me mail if you disagree with any of this, Ciao, 73 de VE6MGS/Mark -sk-

>>misuse this by building the Mother Of All Mailing Lists....

Well, the Mother of All Mailing Lists already exists. It's at
pit-manager.mit.edu under /pub/usenet-addresses and is a multi-megabyte
database of everyone who has posted to Usenet in the past 2 years or so.
(The "recommended" way to access it is via E-mail query. To see if you
are on it, send E-mail to mail-server@pit-manager.mit.edu and in the
body of the message put "send usenet-addresses/name" where name is your
last name or E-mail domain).

While I commend Mark's offer to mask entries and provide net-users with
a modicum of privacy, I think one would be exceedingly naive to think
that there isn't subtle information-gathering at work that will only be
somewhat thwarted when privacy laws catch up with networks. If you wish
to remain truly anonymous, don't post, or post under another name.

>>2) The listed adress is anything reasonable.
>Oooooh, there are so many addresses that are unaddressible from somewhere

>not access them :-) :-)

Well, as Mark alluded to, this isn't a mailing list. It was originally
designed to help authenticate Usenet messages for gatewaying to packet.
It was only after it was created did Mark (and others on the net)
realize its value as a Usenet "callbook." Even if a significant number
of entries have bad E-mail addresses, it's at least a highly recommended
first place to look if you are seeking someone on the net, rather than
posting a bandwidth-wasting "looking for Joe Ham" (which may yield even
less accurate results, assuming you get a reply).

>I am not comfortable with sending e-mail to all entrants that are about to
>be expired, I'd prefer to silently cut them off after 9 months ...

>Send me mail if you disagree with any of this, Ciao, 73 de VE6MGS/Mark -sk-

I think a periodic, time-valued purge is the way to go. Net users
should consider the list the first place to look to find someone's E-mail
address, but not have unrealistic expectations of accuracy.

If you would like your entry corrected, or deleted, then certainly do contact Mike, but be aware of the other information-gathering efforts at work on the net and their implications. You may be trying to hold the tide back with a broom.

Keep up the good work, Mike!

1428. Re: Re: New Radio Shack Scanner (BOGUS!). What we really want. . .!

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 00:47:48 UTC
From: bame@hpfcbig.SDE.HP.COM
Message-ID: <21270012@hpfcbig.SDE.HP.COM>
Source record: 286452

Warning - long.

The message about the computer-control kit for the 200[456] scanners is welcome news to me. I'm pretty sure I saw an advertisement for something sort-of similar for more than $400. Any scanner or other radio with more than 20 frequencies ought to have such an interface. One article about the $1000 handheld scanner (due to such added features) is crap! Yaesu have been putting computer interfaces on virtually everything they make for a long time - and they are competitively priced - and I bet their volume is even lower than RS. In fact, Yaesu use these interfaces for internal manufacturing as near as I can tell. ICOM puts computer interfaces on most of their gear (except handhelds unfortunately) too. Commercial radios often have some computer interface which is used to program the fixed service channels and so forth. The PRO-200* series contains a reasonable microprocessor, something like a 6803, which may even have a built-in unused serial interface. Many of the internal control tasks in those scanners are done via serial (unlike RS-232) interfaces. Lack of a computer interface is criminal. If necessary to keep costs low, the documentation on the interface protocol can be semi-difficult to obtain as it is for the Yaesu and ICOM protocols - but there should be an interface!.

I currently use an ICOM R7000 from a computer to do various scanning tasks and it's an expensive, slow solution to the problem I'd really like to solve, which I admit isn't something most people would want. The computer control board for the RS scanners is closer to a good solution since the scanners are better than the R7000 for high-speed scanning. The "ultimate" product I'd like to see is a simple computer-controlled receiver with *no* user interface (because I don't want to pay for it). Load it with frequency, mode, and so forth and it quickly gives signal-strength back over the computer interface, and audio of course. The interface should be vanilla RS-232 or one of the multi-drop open-collector variants like ham radios use. No funky signalling over the modem control lines or harsh timing would be required - so the few folks in the world (like me) who use Unix instead of DOS for this sort of thing can still use it.

With this building block one can build any type of "scanner" they desire. One thing to do is of course put a nice user interface, case, and power supply around it and sell as a "normal" scanner. The next thing which would happen is a proliferation of PC-based scanning software. Imagine the power of a palmtop computer and a small device such as this.

I (mis)use my R700 as this "building block" much of the time. I'd be real happy to use RS scanners that way instead - but megabucks for add-on computer interfaces isn't real exciting.

My latest experiment is to scan large ranges, say 150-152 MHz, with a normal scanner-like algorithm (e.g., stop on signal). I then lock-out each frequency (no fancy graphical interface, just type 'l') as I understand what they are, and these frequencies are recorded. It's a real fast way to determine frequencies in use and scan for new ones because you never re-scan and stop on frequencies you've locked out. Sadly it's completely beyond even the RS scanners since it requires fairly large memory even though it's a real simple thing to do.

Another simple thing which is foreign to most scanners is not to stop on each signal, but just to record there is a signal there and do so continuously over some period of time. This might be used, for example, to continuously scan all the public service frequencies in some area and produce data about when the most traffic occurs. It might be even more useful in a commercial sense for, say, cellular or trunked system planning. One could quickly scan *all* the involved frequencies for a longish period of time to estimate the system use and therefore plan for adequate capacity.

Indeed! In fact during the spring I received a call from some person
I never knew. He left a message and said he was A&R Research (or somesuch
name) and would like to talk to me. Well, I called him back and
to my surprise, he said he had "heard" that I was interested in operating
systems. All I said was, "Yes, but how did you find out my phone number
and my interests?" They (the research ppl) watch different sources and
he had found my particular information in the comp.os.minix (I assume)
group. He then went on to ask if I'd be interested in working for OSF.

Since I'm starting grad school, I passed up the OSF opportunity (assuming
it was legit). But, it was still weird to have a call like this out
of thin air.

I just found some goodies in a corner of my office. I suspect they are really nice goodies although I don't know exactly what they are (they were left by someone else). I would appreciate any assistance in making a positive identification (exactly what the devices are, specs, pinouts). Here's what information I have:

Manufacturer: Mini-Circuits
Part number: MAR-6
very small round package; 4 pins, one pin at every 90 deg, one pin marked with a dot.

Gary

I beg to differ with you on your statement of "Even if you explain to the
dim bulb answering the phone that......."

I have been a 911 dispatcher starting in 1982 . I know some of my fellow
dispatchers seem to be not all there but we have standing orders to go by
<WHICH I DON"T AGREE WITH ALL THE TIME>. If a dispatcher is PROPERLY trained
no matter what shows up on the E-911 call screen, that dispatcher should
ALL WAYS ASK WHAT IS THE LOCATION OF THE INCENDENT. Who knows, You could be
calling on a TIN CAN and a STRING.......Here in Kentucky every Dispatcher
is mandated BY LAW to attend a 40 hour Basic Dispatch Course and then he/she
must aquire within 2 years a mandated 8 hour refresher <INSERVICE> and must

pass another written test. When you go through Dispatch Basic your final test not only is a written test but you are put at the testing centers radio console and you will receive apx 4 911 calls "TRUE EMERGENCY CALLS" 4 calls for service all via telephone and have apx 6 radio units to handle all almost at one time.....

I KNOW KENTUCKY'S DISPATCHERS ARE TRAINED!!!!!!!!!

Tim Wright KD4OVM
WRIGHT@MOREKYPR.BITNET

Morehead State University Police
Office of Public Safety
Police Communications

BTW: WE train right beside the Police Officers we work with. We do are best to do our job right but the Officers don't understand our Job anymore than they do theirs......8-)

I frequently make use of music over ham radio for test purposes! My normal test-piece is '4 minutes 33 seconds' by John Cage. This is *totally* legal in *all* countries.

BTW, I have numerous live recordings of this work :-) :-)

(For the musicologically disadvantaged, '4 minutes 33 seconds' consists of four minutes and 33 seconds of total silence; it is therfore perfectly legal to transmit either as a conventional audio transmission, or using any conceivable form of encryption/encoding)

>already being accumulated with a call to the main number.

>Solutions:

>1. Eliminate the voice menu machine.

That would be nice....

>2. Take repair/tech service off the machine (if it is used for other stuff).

That would even be better... granted.

>3. Publish the direct bypass number (in ads and on machine) to which a busy
> or no answer condition does not result in toll charges.

>4. Put this on an 800 number.

That's unrealistic because 800 numbers cost big bucks... and they get
abused by customers... I've worked in customer service and it happens
EEB's 800 is used only for orders, as is the case for Universal RAdio...

and they are both service centers also... no service center I know of
that services amateur, shortwave, or general communications gear
uses an 800 number for customer service... overhead must be minimized
and supporting communications gear is costly... so unless a company
has made some big profits, and shuffled some of it to CS, nobody's
gonna get a toll free number for CS.

>5. Make sure the number cannot ever be busy or not answered (probably
> the least practical solution).

I took this and 1 and 2 up with ICOM's customer service head yesterday...
Remember Phil, there's no law or reg that says a CSH number must be toll
free or be or not be on a machine.... ICOM's gear is good stuff...
and I know some of the people in the repair department... Gary Phiber and
others.. they are some hard working people... give 'em a break...
the problem is with management cutting their funds so they put a
machine in.. to minimize on phone time... I know it's a bear..
but ICOM also publishes their address proudly on their ads..
If you don't like it, take time to write... or vote with
your pocketbooks...
At least ICOM publishes a CSH number...that's more than I can say
for other manufacturers...

>Thanks in advance.

well, you can get them from the US Govt.; I've gotten some from

MapLink
25 E. Mason
Santa Barbara, CA 93101
805-965-4402

Their ad says, "Slow service, errors in your order, damaged maps and back
orders may be your experience of special topo map orders from Denver-based
USGS. MapLink thinks it can compete!"

Large outdoor stores often have a selection, also.

Source record: 286616

Nancy Rabel (KC4IYD) asks:

> ... I would like to get information about the QSL card
> manufacturer that your company or local ham club uses ...
> 1) We would be ordering 1000 or more cards for our first order.
> 2) We need someone who does custom work and accepts color pictures

nancy --

check with the local printers in the area as well. both the chains like PIP and American Speedy and the locals. N4LIX found that for her cards she did better going to a local printer than to the QSL speciality suppliers (hers were photo, but i don't recall the amount of color involved).

if you decide to go B&W due to color cost, remember to get your pictures taken with black and white film. much better results than trying to convert a color picture to black and white.

we're going to have to be looking into this also -- next year is the 60 year anniversary of Collins Radio. but then the company has their own print shop and between everyone around the corp, we'll probably be able to get some pretty snazzy cards made up (although the card for the 50th anniversary from 1983 was rather sedate, IMHO) at a nominal price for employees.

Don't forget to ask if they can work off of a PostScript file also. Your group would hammer out the designs on a computer then you send the print file over to the printer where they do the setup and print (of course, if you are as artistically-challenged as i am then maybe it's better to let someone else work on the art work..8-/).

I have had cards made by the Little Print Shop, Rusprint, and W4MPY, generally because I have a tough time coming up with art that is as good as they have and am not ordering the mega quantities to make a big print shop competitive.

how was WDW? tim is still the reigning tetris champ on the game boy.

Here in the US broadcasting industry the latest and greatest thing
is "Wireless Cable" (talk about an oxymoron).

Elsewhere in the world it's known as MDS (Microwave/Multipoint Distribution
System)

I confess it was me. That makes me the original Gasping Geezer.
Please don't throw me in the briar patch (as I remember it)
came from Tails of Uncle Remus. Was a Walt Disney Movie starring
a child star named Bobby Driscoll.

Brer Fox captured Brer Rabbit. Brer Rabbit escaped by telling Brer
Fox not to do exactly what he wanted him to do.

I guess that make me a Gasping Geezer and prowd of it!

Message-ID: <1992Jul30.074928.57656@cc.usu.edu>
Source record: 286621

Ever since I first saw them advertised I've had a question in my mind about these half-wave outfits. My house sits on a lot that is not overly large, thus the "no ground radials" feature is quite attractive. However, what I look for in an antenna of this type is a low radiation angle. Hence my question: what's the radiation pattern of these things look like? I'd hope for something at least as low as a 1/4 wave vertical over as-close-to-ideal-as-possible ground. (Which around here is "not very", unless I take a field trip, as I have on a couple of FD outings, and plant my vertical in the Great Salt Lake.)

I don't recall any ad I've read addressing the radiation pattern. When I opened my August QST I was encouraged to see that AA2Z had reviewed the R7 only to be disappointed by a well-I-hooked-it-up-and-this-is-what-I-heard asessment. Not as much as an allusion to the question I wanted to see answered.

So, I throw it out to the antenna gurus on the net. What kind of take off angles can one expect from an antenna of this type? Just what does the part of the antenna that comes in the box work against? What installation specific factors affect the pattern (in elevation)?

Also...

In article <6NPooB2w164w@phsbbs.princeton.nj.us>, n2gj@phsbbs.princeton.nj.us (Gerry Jurrens) writes (under the subject "Cushcraft R7 Installation"):

[stuff about installation and first impressions deleted]

1446. Wanted: Opinions on 2m/440 mobile radios

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 13:57:30 UTC
From: davy@ecn.purdue.edu
Message-ID: <1992Jul30.135730.26415@noose.ecn.purdue.edu>
Source record: 286622

I'm planning to buy a dual-band (2m/440) mobile for my car in a couple of months, and would like to solicit people's opinions on what to buy.

I have one restriction: due to space limitations and the desire not to puncture my kneecaps on a regular basis, I am only considering the radios with a detachable front panel that let you stash the rest of the radio in the trunk or under the seat.

So, if you have one of these, could you tell me:

- Make and model
- Things you like about it
- Things you don't like about it
- What notable features does it have?
- Where you mounted the front panel, and how (Velcro, etc.)

Right now I'm kind of leaning toward the Alinco DR-590, which has, in addition to all the usual stuff, out-of-band receive up into the 800MHz range (with a suitable antenna, of course) and scanning functions. I don't use scanners much, but with the space restrictions in my car's cockpit, the ability to do this with the radio instead of a separate scanner seems desirable.

Please reply via mail to me; I'll summarize to the net if I get anything useful.

Thanks,
Dave Curry, N9MSW

My experience with an Avanti glass mount was quite good. You MUST remember to ground the coax to the car at the coupler box. The Avanti comes (came?) with a clip and a short piece of braid. I was able to find a screw near the mount point that made a good connection to the body. In this configuration the antenna works better than a quarter wave and similar to a 5/8 wave. Not as good as the 1/2 wave J that I had on the bumper for a while.

Another friend installed one of these and didn't ground it and found that performance was very bad.

The downside with these antennas is that it will pop off very easily if you hit an obstruction like a low garage door. I stopped using it when I started keeping the car in the garage.

>

I live on the 'fringe' for the repeater I frequent. Over the last 7 years, I've had a succession of cars with various antenna installations ranging from a 1/4 wave Mag mount, 5/8 wave mag, 5/8 Larson on an NMO mount on the trunk, etc.

On the current 'leased' car, I put an ASP glass mount, that resembles a cell phone antenna. (Slightly larger and tuned to 2 meters).

The results have been essentially equal to the 1/4 wave mag mount on the roof.

I happened upon a Commodore 64 (processor in the keyboard sort of thing), monitor, Vic disk drive, etc., in the closet of a relative who bought it and never used it. It appears to work, runs diagnostics and whatnot, and I'm told some people still know how to use these and play with them. I could barely stand to try to use it. Does anyone actually use these anymore?

I'm told these things have a going rate of $150 with a working drive. I'm incredulous. If anyone is interested in this computer or knows anyone who might be, I'd be VERY reasonable on the price and would ship it. If you demonstrate that you represent a club for kids (other than Boy Scouts of USA) or some other social service, the cost of my hassle for shipping this to you will be even more reasonable. I'd really hate to just throw this thing into some land fill, but I can't even find a local hardware/tinkering junkie to take it.

Hmmm, I bet there are no fewer than 100,000 print shops in the USA that can do the same job! Probably even one or two in your own neighborhood. Why not Try your local print shop, you might be surprised at what they can do. At the minimum, you will be helping to reduce the US trade deficit.

1456. Ham Radio in Europe

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 15:20:30 UTC
From: tlanders@atlastele.com
Message-ID: <1992Jul30.152030.5611@atlastele.com>
Source record: 286577

Hi. I am new to ham radio. I am currently studying for the non-code tech license. I will be purchasing a 2m handheld as soon as I get my license. I have a question that none of my study books seem to answer...

My job occasionally takes me travelling internationally, particularly to Europe. In addition, there is a possibility that I may move to Europe for an extended stay (~3 years). My destination country will probably be Germany, Switzerland, or Belgium. Does anyone know if it will be possible for me to transmit with my 2m radio? Will I need to get a license in the country that I end up in? Do they even use 2m in Europe? Also, do radios need to be approved by the governments of Europe before use? Is there anything else I should know?

Thanks a lot for any help you can provide.

Message-ID: <1992Jul30.152644.5764@atlastele.com>
Source record: 286478

Hi. Me again. I am in the market for hand-held 2m. I noticed that in the ht_info file in the archives, there are several modifications mentioned for several types of radios. The radio that I am most interested in is the ICOM IC-P2AT. Are there any usefull modifications for this radio? Also, one of the modifications mentioned for the IC-24AT was that a keyboard entry could make it receive 100-1000MHz. Does this work on other ICOM radios? On the IC-P2AT. Are these sorts of things common?

Thanks for all responses.

Date: 1992-07-30 15:36:02 UTC
From: kawai@Csli.Stanford.EDU
Message-ID: <1992Jul30.153602.806@Csli.Stanford.EDU>
Source record: 286532

Thomas L. Carney follows up on Phil Howard's article:

| | 4. Put this on an 800 number.

| That's unrealistic because 800 numbers cost big bucks... and they get
| abused by customers... ... overhead must be minimized and supporting
| communications gear is costly... so unless a company has made some big
| profits, and shuffled some of it to CS, nobody's gonna get a toll free
| number for CS.

I'd like to provide a data point for comparing costs involving 800-number service.

I have 800-number service at work. (This is for collecting speech data over the telephone -- I work on speech recognition, and one of our applications is speech recoginition over the telephone.) I have ten 800-numbers connected to AT&T via Pacific Bell for service in the lower 48 states including intra-state and local calls. For the last several months, bills have been about $5,000 to $6,000. On average, it costs just about $10 per hour of telephone time (somewhere between $9.90 and $10.30). This includes basic charges, actual telephone charges, and so on.

If you have one telephone line supporting one 800-number, and if the line is in use 8 hours a day, that's about $80 per day. If your store is open 7 days a week, 365 days a year, that's just under $30,000 per year, or about $2,500 a month. If you decide you need more than one telephone line for the same 800-number, you will need to increase your monthly budget. In any case, by limiting the number of telephone lines and the number of hours you will answer calls, you can put a maximum cap on your telephone bill budget.

Considering the high cost of advertising in magazines and other publications, and also considering the positive impact 800-numbers have on public relations, I would suggest that large corporations (especially manufacturers such as Icom, Kenwood, and so on) ought to invest in 800-number service for customer support.

Unfortunately, I cannot comment on customer abuse -- all my callers are volunteers for a research experiment and are fully cooperative.

From: NW0U R100GS XT350 (null)DoD#0693 Me too!

There is a corner-case where nav beacons are actually used as remote
transmitters in low density areas of the country. But it's not worth
the circuitry to receive.

BTW, the Morse IDs of VOR beacons is being replaced by voice ID. Even
when the characters for the 3WPM code was printed on charts it was
deemed an unnecessary distraction. As a ham, ID'ing beacons was
trivial, almost subconscious even........

The compulsive DX'ers will probably start a whole new award: Worked all VORs!

1461. Re: tube numbers

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 15:55:01 UTC
From: ornitz@kodak.kodak.com
Message-ID: <1992Jul30.155501.10431@kodak.kodak.com>
Source record: 286534

In article <Bs66BM.Jys@ux1.cso.uiuc.edu> rtaylor@ux1.cso.uiuc.edu
(Roger Taylor) writes:
>The guy who borrowed my tube substitution never returned it. Can
>anyone tell me the approximate equivalents to:
>8032, 6883, 6463, 6688, 6202, 5896, 5847, 5636, 5670, 5672, 5686,
>5702, 7984, 6888, 5852. TNX. K9ALD

I was able to find suggested replacements for several of the tubes asked
about. Listed below are data from RCA and GE industrial tube guides and
from a GE domestic tube guide. The domestic replacements may not be
identical replacements in all applications.

TUBE TYPE RCA GE DOMESTIC COMMENTS:

8032 8032A/ 8032A/ 12 volt 6146 equivalent
6883B/ 6883B/
8552 8552
6883 " "
6463 6463
6688 6688A 6688
6202 6202 6202 6X4 Slightly different ratings
5896 5896 5896A
5847 5847/ 5847/ 404A
404A 404A
5636 5636A
5670 5670 5670 2C51
5672 5672 5672 "Peanut" tube
5686 5686 5* (high reliability)
5702 "Peanut" tube
7984 7984 IVS transmitting tube
(compactron)
6888
5852 6X5

A few of these tubes are still manufactured in the US by the employee owned
company that bought out GE's plant in Lexington, KY, when GE closed the plant.
They make mainly small industrial varieties including a few transmitting
tubes like the 807, 6146, and 7984. They also make a few of the more popular
domestic varieties. Most small vacuum tubes are now made in eastern Europe.
I guess the replacement market and the audio "phreaks" are a big enough
market to keep these companies going.

1465. Re: What's a Mini-Circuits MAR-6?

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 17:06:53 UTC
From: frankb@hpsad.sad.hp.com
Message-ID: <27890024@hpsad.sad.hp.com>
Source record: 286553

*I just found some goodies in a corner of my office. I suspect they are really
*nice goodies although I don't know exactly what they are (they were left by
*someone else). I would appreciate any assistance in making a positive
*identification (exactly what the devices are, specs, pinouts). Here's what
*information I have:
*
*Manufacturer: Mini-Circuits
*Part number: MAR-6
*very small round package; 4 pins, one pin at every 90 deg, one pin marked with
*a dot.

It is a "broadband monolithic amplifier". 50 ohms in/out. DC-2 GHz.

gain in dB (typical):
100MHz 500MHz 1GHz 2GHz min gain at 2GHz
20 dB 19 dB 16 dB 11 dB 9 dB

1dB gain compression point: 0dBm output
max input level (no damage): +15dBm
noise figure (typical): 2.8dB
third order intercept (typical): +15dBm
VSWR: input 2:1 output 1.8:1 (worst case)
16 mA 3.5V
$1.29 each in quantities of 25.

The dot in the RF input. The lead across from it is the RF output and bias.
The other two leads are ground. You need a resistor from the RF output
to your power supply. Add a choke if you use a small resistor value.

You need blocking capacitors on input and output, so it doesn't really
go down to DC.

power supply:
+5V +9V +12V +15V
98ohms 344ohms 531ohms 719ohms (approximately) There is some device to
device variation on the bias, but you want around 16 mA. It blows up at 50mA.

The SWR spec isn't terrific, but the spec is over the 2 GHz range. They are
much better below 500 MHz. The charts show about 1.1:1 input and 1.2:1
output at 500 MHz (typical numbers).

They can be useful for cheap preamps.

>I think the spirit of the regulation was to prevent people from pretending
>to be a broadcast station and competing with the real broadcast stations.
>I'd bet my reputation that the FCC doesn't care if you send digitized music
>or letters representing musical notes or digitized images of sheet music as
>long as the average Joe listening on his shortwave receiver can't hear the
>music.

Of course. If you want to understand how FCC views the rules, it's always
useful to start from the point of view of the FCC. They don't want
amateur stations to be "broadcasters," and the rules are written with
this in mind.

But that's not nearly as much fun as making outlandish interpretations to
try to stop everyone else from doing that which they find useful or fun.
In that spirit, I note that Webster's Ninth New Collegiate Dictionary
contains the following:

music: ... 2 a: an agreeable sound : EUPHONY <her voice was ~ to my ears>

I therefore declare all repeater courtesy beeps, chimes, gunshot sounds
and any other sound anyone finds agreeable, *including CW* blatantly
illegal.

Ob. disclaimer for the humor impaired: it's a joke, sorta.

Hi, Everybody !

I read "Vertical Antenna Handbook", by Capt. Paul H. Lee,
CQ Publishing Inc. The author says "vertical antenna does
not cause more TVI and BCI than horizontal antenna" in his
book in p.126.

Is it true ?

I think vertical polarization wave causes more common-mode
interference voltage in TV antenna feeder.

Define "music". How (and where) does the FCC define "music"??

I suppose I could transmit RAP all day long, cause (by my definition) it
ain't "music".

It seems to me that there are a lot of sections of Part 97 that need
updating. A re-write is in order and not just a patch job.

Well, some of us don't like the name ARRL, most don't like AARL, and
AARRL has provoked Jay to cough up a fur-ball. :-)

So let me call upon the Collected Wisdom of the Net. What would be
YOUR new name for ARRL?

In article <LVDooB4w165w@pranny.UUCP> lee@pranny.UUCP (Lee Reynolds) writes:

Anyone out there happen to know of any definitive source
of data on the BCD format? Trying to do some translation.
Books, papers, etc., all leads gratefully accepted.

Thanks,
Lee.

Isn't BCD simply using 4 bits to count from 0 to 9?
The rest of the possibilities (A-F, or 10-15) are disallowed.
So, to count from 0-99 requires 8 bits, 0-999 requires 12 bits, etc.

I'm sure I'll be corrected if I'm wrong.

1475. Looking for recommendations for 2M/440 base antennas

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 18:23:38 UTC
From: rossi@gvlf9-q.gvl.unisys.com
Message-ID: <1992Jul30.182338.14771@gvl.unisys.com>
Source record: 286548

I recently bought a dual band 2 meter/440 HT. For years I have wanted
to put up a 'decent' 2 meter antenna on the house so now I looks like I am
looking for a dual band antenna instead.

I am looking for something along the line of the Diamond X500 series. That
general size/price category. For now, the antenna would be mounted on the
peak of the roof about 30 feet above the ground. It may eventually get moved
to a 60 foot tower.

The X500 sounds perfect but I have heard that it has some structural problems.
I want something that I can put up and not have to worry about, but also don't
want to spend much over around $200.

Looking for any general recommendation/comments on the Diamond vs. some
of the other manufacturers of similar antennas. I saw part of a thread
about the X500 recently but our News server was having some problems around
that time and I lost most of them.

Please e-mail and I will post a summary if I get enough responses.

VHF notch filters

Amateur VHF stations can interfere with antenna-connected televisions. Television tuners do not often have much adjacent-channel rejection, resulting in severe fundamental overload. These tunable notch filters will reject the strong amateur signal, allowing the television to function normally.

Note: these filters will not help when an amateur signal is interfering with cable channel 18 (channel E). In that case, the problem results because cable channel 18 and the Amateur 2-meter band occupy the same frequencies. Some of these filters are expensive. Contact the vendor before ordering.

Microwave Filter Company
6743 Kinne St
E Syracuse NY 13057
(315) 437-3953

Filter: 5KMT-A-I (reject 108-170 MHz)

When both volume levels are turned all the way down and the squelch is set to a normal operating position, and a qso is taking place on a repeater on vhf, I can hear popping noises whenever the repeater is accessed. I suppose this could happen on uhf also, but I haven't noticed it yet.
Has anyone else noticed this phenomenon, and is this a bug in the design?

>Any suggestions would be welcome.

>Paul Risk, N1DJD, Nacogdoches, TX

Paul,

The automotive-interference problem has been in a state of confusion since February 92. :-). John Harmon, W8JBH, wrote a piece for QST Correspondence about his 1992 Toyota Camry. There were additional items in the March and May issues.

The questions raised in the QST Correspondence column, and on packet and computer networks around the country, prompted me to investigate the situation. After placing a few calls to friends in high places, I obtained a list of automobile manufactories Customer Relations centers. (This list was posted to Internet a few months back -- if anyone missed it, send email to ehare@arrl.org and ask for the electronic copy of our auto manufacturers list.) I then composed a letter asking the following questions:

o What are your company policies about interference to or from Amateur Radio equipment installed in your vehicles.
o Do you have any service bulletins relating to electromagnetic interference?
o Whom should customers contact to resolve interference problems that cannot be solved by the dealer.

So far we have received responses from American Honda, American Isuzu, Chrysler, General Motors, BMW, Porsche and Mitsubishi. These responses have been mixed. Most obviously contain the fine workmanship of both the Marketing and Legal Departments. I am compiling a summary of the responses that will ultimately be made available to our members (and probably non-members, too -- most of us don't have time to actually check) or published in one or more of our pubs (TBD) In the meantime, if anyone is having a problem, I will postal mail a copy of the individual manufacturers letter to you. Send email to ehare@arrl.org, including your postal address and a specific request for a particular manufacturer or two, along with a description of the type of problem you have been experiencing (model number, history, etc., if possible). You don't need to get real long-winded. :-).

Among the more interesting responses included two from the same company that said two different things! (It was even the same street address -- just different mail stops.) They did straighten out the misunderstanding, so they will remain un-named, but this serves to emphasize a point -- many of the problems experienced getting an interference problem resolved stem from poor communication and misinformation, not necessarily corporate intent. One of the side benefits of this is that we have convinced auto manufacturers and importers to evaluate their policies about automotive interference at a corporate level. This will help hams when the dealer starts screaming "It's never our fault!" The letters we have from their corporate offices will help amateurs and auto dealers resolve the problems that have been reported. Routine inquiries will receive the summary of responses, but these letters will not be an ARRL Deep Dark Secret -- folks having a specific problem with a vehicle will be able to get a copy by talking to me. The only reason we don't want to bundle them all up as a handout is that we don't want to spend the paper and postage to send out twenty or thirty pages for casual requests.

Now, I will use two letters from GM as examples to your specific question. A letter from GM Electromagnetic Compatibility Department states:

"General Motors extensively tests each vehicle for immunity to on and off-board transmitters ... The end result is minimal interaction with any user-installed two-way radio equipment.

"<Our customer - refer to May QST> was assured that he is able to install an HF radio in his new 1992 Pontiac and that the warrantee on the 1992 Pontiac will not be affected by the installation of that radio."

On the other hand, a letter from Oldsmobile to a customer states that the installation of a "high-output unit" could have an adverse effect of the operation of the vehicle. I have been assured by the GM EMC Department that the more positive letter does indeed represent GM policy. Both of these letters were on file here before our "official" request was sent, and I am still waiting for an official response from GM (among many others). This is not surprising -- I am sure the people writing the letters have to clear them with Marketing, Legal and PR before they can go out the door.

Watch Internet and QST for further developments. In the meantime, we do have a Technical Department auto EMI package called "RFI - Automotive". It is a paper copy, so send email to ehare@arrl.org with your postal address and a specific request for the "RFI - Automotive" package. It contains reprints of the GM, Champion and Mercedez-Benz mobile installation guidelines.

Source record: 286549

tlc20700@uxa.cso.uiuc.edu (Thomas L. Carney) writes:

>>5. Make sure the number cannot ever be busy or not answered (probably
>> the least practical solution).
>
>I took this and 1 and 2 up with ICOM's customer service head yesterday...
>Remember Phil, there's no law or reg that says a CSH number must be toll
>free or be or not be on a machine.... ICOM's gear is good stuff...

True. And I would never propose such a law, either. If they want to
conduct business in a way that I happen to think is bad and would put
off customers, that is their right.

>and I know some of the people in the repair department... Gary Phiber and
>others.. they are some hard working people... give 'em a break...

There's nothing wrong with the people there. In the past when I could
easily get through (yeah, I had to try several times because the phone
was busy, or let it ring for a while when they were busy with non-phone
stuff, but at least I didn't have to pay the toll charge until I got
connected to someone) they were very very helpful and knowledgeable people.
I have no reason to believe that has changed. I have no way to find out
now, either.

>the problem is with management cutting their funds so they put a
>machine in.. to minimize on phone time... I know it's a bear..

It really does not minimize much. Icom saves a few bucks (they did have
to buy the machine remember) but the customer now pays more. Your long
distance carrier is the beneficiary.

The calls either get answered or the messages are replied to. At least
they have the advantage of calling you back when it is convenient with
them. Unfortunately that can lead to phone tag. If I go home during
the day from work to place the call, I cannot stay there for the rest of
the day waiting for when they call, if they even do call.

Maybe the non-response to messages not left more than N times (N is chosen
to determine the desparation factor of the customer) is their way of saving
money beyond the cost of the machine.

>but ICOM also publishes their address proudly on their ads..
>If you don't like it, take time to write... or vote with
>your pocketbooks...

Exactly. I did leave a message. Since that appears to have not
changed anything, maybe writing will. Maybe. The pocketbook is

the next step.

>At least ICOM publishes a CSH number...that's more than I can say
>for other manufacturers...

Yaesu has an 800 number. I've even gotten technical questions answered over that number. I just don't like Yaesu gear... Icom gear is still the best around (Kenwood is second, and I have not tried some of the other brands at all so I cannot place them).

They COULD publish numbers like:

1. repair service direct (ring or busy)
2. repair service message/callback
3. literature request message/callback
4. technical info direct (ring or busy)
5. technical info message/callback

It would mean a little more text in their ads, but most of the ads have the room for it. It might be the same people answering repair service and technical info, but at least with separate lines they can apportion the duties as needed.

1486. Ramblings of an OF.

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 19:40:16 UTC
From: mdc@vixen.uucp
Message-ID: <1992Jul30.194016.25548@porthos.cc.bellcore.com>
Source record: 286545
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.packet

To : All of those who hate, like, love the ARRL.

As many will tell you it is a very rare occasion for me to "take pen in hand" and post something to the net.

I have been following all the "chit-chat" regarding: 1.) Ohio protesting, 2.) AMSAT is better than the ARRL, 3.) ARRL is better than AMSAT, 4.) HF packet, 5.) non-HF packet, 6.) etc.

I am a member of ARRL but I find it of little value to me. I keep my membership because I do not know of any other organization with the "clout" in Washington that the ARRL does. I feel that if I ask someone to do something for me (use their "clout" for me in Washington) I should be willing to aid them financially or some other way. So I say to you "ARRL bashers" until something better comes along swallow your pride and work within the limitations of what you have. I do not think I would like to have my company represented by the "good old boy" psychology that "the nine old men of Newington" (anybody remember FDR these days) have but I guess it would be better than no representation.

To me QST is a catalog of advertising. Since I am arthritic and also a business person and (without any derogation) not an EE. Trying to wind 4000 turns of number 40 wire on a T-5000 core with taps every 15 turns is not only impossible but leaves me cold. Why can't we have more on the fun of Hamming and less on the projects for the homebrewer. I take my hat off to the people that design these things and do it doubly for those that build them and make them work. You may say "why don't you write an article or story." Believe me my wife is still laughing at my latest attempt at that and it has been five years now.

I disagree with the ARRL on their approach on packet on HF. I agree 1000% that when they bring up W1AW they should not be required to check each frequency to see if it is clear. In both cases I have let my feelings be know.

This may be the ramblings of a 65 year old advanced amateur who enjoys packet, AMTOR, RTTY; loves to rag chew and *ESPECIALLY* loves CW, *BUT* for the life of me can not understand Newingtons hang up on 13, and 20 words of CW per minute to be able to upgrade. I guess it is the "I know it is modern times with computers, TNCs, ROBOTS, etc. but I suffered to get my upgrade and I will not hold still for you not suffering like I did".
GOD HELP US ALL.

I assume this will generate some flame, but so be it. The only thing I ask is send it via e-mail since the net is cluttered up enough now.

73s for all the guys and 88s to all the gals. (Sexist remark acknowledged.)
All standard disclaimers should be applied at this point.

1489. Re: WANTED : ICOM Customer Service phone number

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 19:50:01 UTC
From: pdh@netcom.com
Message-ID: <14pm2-n.pdh@netcom.com>
Source record: 286550

kawai@Csli.Stanford.EDU (goh kawai - n6uok) writes:

>Unfortunately, I cannot comment on customer abuse -- all my callers are
>volunteers for a research experiment and are fully cooperative.

I don't know what specific kinds of abuses CS numbers might encounter,
but I have heard that the clone computer makers are getting what they
consider "abuse" at 60% to 75% rates (by number of calls). These are
often cases of people asking how to operate the computer. But they are
writing off this abuse for the most part as part of keeping their business
in good standing with their (shinking) customer base.

One of the things I call the radio manufacturer CS number for is to get
technical info on products that is not available in the literature, or
is explained ambiguously. For instance some radios have one memory space
that can store a frequency from any band, and some other radios have a
separate memory space for each band and that memory can only hold a
frequency for its associated band. The sales people have no comprehension
of the difference. One radio might have 20 memories and another have
10 on 1 band and 10 on another but they advertise it as 20 (total, yeah,
but only 10 for the most used band). At least the technical people know
this stuff because they get to play with most of the radios. I understand
that even this is getting cut back.

I hope they don't think it is an "abuse" to get technical info above and
beyond what the sales/marketing people are trying to feed me.

Next month: Why ICOM doesn't allow allband receive on the UHF side of
their dualband transceivers, and limits coverage to just 1/3 of the band.

>cscon0151@uoft02.utoledo.edu

The PRO-43 is a "new" entry in the market. In fact, replacing the top of
the line RS handheld. It should at least be up to the standards set by
the ICOM R1, AOR1000 and others. If fact, it should surpass them leveraging
the latest technology and innovations suggested by other scanner designers.

Certainly we can expect a "handheld 2006". Anything less is retrograde and
warmed over leftovers. The PRO-43 is kinda like SPAM.

1494. Re: AARL vs ARRL

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 21:09:30 UTC
From: carndt@zeus.calpoly.edu
Message-ID: <1992Jul30.210930.1187463@zeus.calpoly.edu>
Source record: 286552

The summary to date (sort of :-)): ARRL is thinking of a name change to AARL (American Radio Relay League to American Amateur Radio League).

Some people don't like AARL because of the similarity to AARP (American Association of Retired People). I feel this way, also.

Someone suggested (tongue in cheek, I believe) AARRL.

I agree a name change would better identify the amateur radio nature of the League.

How 'bout rearranging the favored AARL to ARLA (Amateur Radio League of America? It keeps the same initials, avoids the association with AARP, and rolls better off the tongue than AARL.

1495. Newsline availabe on Usenet?

I have heard that Newsline is available electronically from some BBS systems around the country. I'm wondering if it could be made available to Usenet as well. Since I know _absolutely_nothing_ about how it's distributed to the various repeaters who play it, nor firsthand experience about electronic availability, I decided to do what other clueless people do: Ask the net. :)

If it's not available on the net, would some poor sod be interested in transcribing it? (Assuming no copyright issues, of course).

1496. 2m/440 homebrew antenna summary

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 21:57:10 UTC
From: jmccombi@testament.bbn.com
Message-ID: <l7gpdmlNN6oo@news.bbn.com>
Source record: 286568

Thank-you to the many folks who sent e-mail with advice on homebrew 2m/440 antennas. Several people asked for a summary; this is it.

THE SUGGESTIONS:
By far the most popular solution was the 2m J-pole which is reported to work well on 440 MHz. Plans for the "Copper Cactus" J-pole are in a recent edition of 73, and for the "Electrician's Delight" J-pole in a recent edition of CQ. [E-mail to me if you need exact citations.] The J-pole is also discussed in the ARRL Antenna Book and/or the Handbook. Finally, I received two (slightly different) plans for a 2m J-pole made from 300-ohm TV twinlead.

Two folks suggested I buy (e.g., from Radio Shack) or build (plans in Antenna Book(?)) a discone antenna. This antenna will present unity gain at best, but should present < 2:1 SWR across all ham bands 2m thru (way-the-heck-up-there).

One person noted that fanned dipoles work fine at HF, and suggested that I modify my existing 2m 1/4-wave groundplane by adding elements for 440.

THE RESULTS:
I already had--and routinely use for public service events--a copper-pipe J-pole built from plans I got off the net, so I tried it out using a dual-band HT and an SWR meter designed for 140-450 MHz. SWR curves were (still) OK on 2m but never below 2.5:1 on 440.

I built a Copper-Cactus J-pole from the plans in 73 (the single J-pole, not the "double cactus). It presents better SWR curves on 2m, dipping to 1:1 at 146 MHz and about 1.3:1 at band edges. SWR performance on 440 was better than the other J-pole, at about 1.5-2.0:1 across 440-449 MHz.

Next I built a TV twin-lead J-pole. After some trimming, I got excellent SWR curves on 2m but awful performance on 440, never below about 2.5:1.

Finally I attacked the multi-element ground-plane idea. Not wanting to climb on the roof and un-mount my existing 2m 1/4-wave groundplane, I built a new one from plans in the Antenna Book. After trimming, SWR curves on 2m were excellent. For curiosity's sake, I tried running this unmodified 2m 1/4-wave ground-plane on 440. To my surprise, it performed well, with SWR under 1.3:1 across the band.

Next I added an additional element to the vertical element and each of the the radials, each element cut for 440 MHz. There was no noticeable difference in 2m SWR curves, and the 440 SWR curves actually got worse!

Thinking that perhaps I had happened upon the right length of coax to make an impedance transformer, I tried using different lengths of patch

cords (3 ft. vs. 5 ft. vs. 7 ft.) and of different types (RG-58 vs. RG-213). My results didn't change. I also tried the 2m 1/4-wave on my roof with 146 and 440 MHz. SWR curves were similar to the unmodified 2m groundplane in the shack.

I do not have antenna modelling software nor have I done any tests of the radiation patterns of any of the antennas I played with. [Pointers to something like NEC for a Macintosh would be appreciated...] Follow-ups are encouraged, either via private e-mail or on the net. (See also my much shorter posting following this one, subject "2m qtr-wave ground-plane on 440?")

1497. 2m qtr-wave ground-plane on 440?

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-30 21:58:54 UTC
From: jmccombi@testament.bbn.com
Message-ID: <l7gpguINN6pb@news.bbn.com>
Source record: 286569

I have been tinkering with homebrew 146/440 MHz vertical base-station antennas. (See also my earlier post, subject "2m/440 homebrew antenna summary.")

For curiosity's sake, I tried running a 2m 1/4-wave ground-plane on 440. To my surprise, SWR measured in at under 1.3:1 across the band. (Equipment: dual-band HT running 5W out on both bands; Daiwa Pwr/SWR meter for 140-450 MHz). These measurements appear to be independent of feedline length (longest feed line was approx. 20 ft. of RG-8, shortest was 2 ft. of RG-213; also tried 3, 5, and 10 ft. of RG-58).

I'm confused. Why does the 2m 1/4-wave groundplane work on 440? As a 3/4-wavelength groundplane (146*3=438 MHz)? Could I make my groundplane any odd multiple of 1/4-wavelengths and have it work OK? Perhaps someone with antenna-modelling software can help shed some light on this... what sort of radiation pattern does one get from this sort of antenna?

Thanks in advance and 73 de
Jon N1ILZ

1498. indoor antennas

Newsgroup: rec.radio.amateur.misc

Message-ID: <1992Jul30.220145.4533@uxa.ecn.bgu.edu>
Source record: 286551

Can someone suggest a good antenna for use indoors e.g. a mobile antenna that could be attached to a table. present QTH doesn't allow outside antennas. I'll be running mostly 40meter SSB.
Second question: Having been out of things for a long time what are the bands allowed General class. i used to know the frequency allocations but I've forgotten. Thanks.

Source record: 286554

So far I have seen numerous messages concerning the ext rec mod for the 732... most call for "cutting the green wire"....running numerous jumpers here and ther e....from info I have received this is what has worked for me.....Move R20 to R19....reset the micro-proc and you should get the following.

118-174 RX......136-174 TX......410-470 RX/TX......800-1000 RX

if for some reason you do not get the same freqs then follow instructions on page 38 concerning "VFO reset of one band only"....whichever band is giving you problems.....to "hear" 800 Mhz I put a 22pf cap "IMMEDIATELY" to the right of IC202...there are two "little" solder pads there.....not a lot of room to work.. a couple of coils very close to pads....anyway this is what worked for me...it should work for you...NO GUARANTEES HERE FOLKS.....JUST PASSING ALONG SOME INFO. ....hope if works for you. REMEMBER THIS MOD WILL ALLOW YOU TO TRANSMIT OUT OFBAND SO BE CAREFULL!!!!

I knew a fellow who got his Phd (no kidding) with a thesis on morse code
learning.(*) Since I was having the same problem as you, I asked him about it.

He said to turn the code character speed up to at least 26 W.P.M., so you
can't count the dots and dashes but have to learn the sound of the whole
character.

It worked for me.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

1509. Re: More Cushcraft R7

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-31 11:20:11 UTC
From: wvanhorn@magnus.acs.ohio-state.edu
Message-ID: <1992Jul31.112011.12306@magnus.acs.ohio-state.edu>
Source record: 286481

In reply to the request for information about the Cushcraft R-7 multi-band vertical half-wave antenna from Scott Parker - WA7VYJ:

I have an R-5 that I have had up for two years; also I have both Elnec and MN antenna analysis software on my computer. I am no "antenna guru", but will offer the following opinions for what they may be worth.

First, computer analysis is not much good for exploring the questions you have asked. The Mininec program that was developed by the government and is the basis of all the commercial packages is not capable of analyzing ground losses. Also, for analyzing the vertical radiation pattern it assumes flat, unobstructed ground in the immediate vicinity of the antenna. Houses, fences, trees, electric wiring, etc. in the area clearly cause major effects in most real situations but cannot be treated analytically. Unless you can permanently mount your antenna in the waters of Great Salt Lake, you have no choice but to accept anecdotal reports as a guide, no matter how unreliable they may be in a particular situation.

I have read most of the popular antenna books written for hams and feel that "HF Antennas For All Locations" by Les Moxon, G6XN, is the best single guide available. He punctures many myths. The first is that quarter-wave vertical antennas must have ground radials. He makes a good case that a counterpoise is better; that it has lower losses as well as being much, much more convenient.

Second, he makes an excellent case for the fact that vertical antennas are better low angle radiators than horizontal when both are mounted at heights lower than about 3/4 wavelength.

My limited experience seems to verify this latter fact. I have a dipole as well as the R-5 at roughly the same height (35' at the base). I find that the R-5 gets about one "S" point better reports in most DX contacts on 20 meters, which is the only band on which both can operate. I live on a small suburban lot surrounded by houses, power lines, trees, fences, etc. and have logged about 150 countries in the last few months with 100 watts output on cw.

My R-5 is limited to 20 meters as the lowest frequency of operation. I believe it is a superb performer because its overall length of 17 feet is at least a half-wavelength on all bands. When Cushcraft extended the principle to make the R-7, they added

only 8 feet so that on 40 meters the overall length is less than 1/4 wavelength. This is getting a bit short and the radiation resistance inevitably drops off. I read one posting that reported a Field Day installation where both an R-7 and a dipole at some 50 feet height were available; the dipole seemed to get 1 or 2 "S" points (6 to 12 db??) better reports on 40 meters. This seems reasonable to me, but I have no direct experience.

Good luck and 73, Van
wvanhorn@magnus.acs.ohio-state.edu

1510. Re: Not all 911 ops are DIM BULBS

>calling on a TIN CAN and a STRING.......Here in Kentucky every Dispatcher
>is mandated BY LAW to attend a 40 hour Basic Dispatch Course and then he/she
>must aquire within 2 years a mandated 8 hour refresher <INSERVICE> and must

I know that dispatchers are trained, and some of them are hams who
understand autopatch, but that doesn't mean there aren't dim bulbs
out there answering the 911 calls. We see examples here on the net
of college graduates, people with at least 16 *years* of training,
who can't compose a coherent sentence or spell. A 40 hour course
won't make up for that. Many dispatchers just follow the book and
push the button. We've had fire trucks show up on the mountain in
response to autopatches. We've had police show up. And that's after
the dispatcher was clearly and repeatedly told that the call was
a mobile radio call and the correct location given.

>BTW: WE train right beside the Police Officers we work with. We do are best
>to do our job right but the Officers don't understand our Job anymore than
>they do theirs......8-)

See, you're capable of generalizations too. :-)

>for an antenna mast? The antenna will be a small 2m ant. Probably
>a Lazy-J or a 5/8 whip with radials.
>
>a) Is PVC durable? Will it live thru a few seasons?

PVC is durable as long as it is not exposed to sunlight. UV exposure weakens
the chemical bonds.

>b) How long a length of PVC pipe will stand straight by itself? What about
> wind? (This will be mounted off my roof, somehow).

This depends on diameter and wall thickness. Longer lengths of larger
diameter pipe will freestand while shorter lengths of small diameter
pipe will. There are standard civil engineering formulas that will show
you what diameter and wall thickness is required for a given height to
be code compliant. Similarly, wind loading is a function of cross sectional
area and length. Larger pipes are stiffer than smaller pipes. Four inch
PVC will selfsupport for any reasonable VHF vertical. If the pipe is
less than four feet long, half inch pipe is suitable. Longer than that,
it whips unacceptably in the wind.

>c) If PVC cannot take the "elements", will painting or protecting it help?

Yes. Painting will reduce the amount of UV striking the material. A high
titanium oxide containing white paint is best.

>d) Will it affect antenna performance? I don't think so, but.......

Metallic base paints can affect antenna performance. Such paints include
"aluminum" paint and metal "flake" paints. Radome paint is a very good
choice since it's formulated to work with antennas. For high power work,
PVC itself is a RF absorber and can melt. But that's unlikely at modest
amateur power levels.

>What about PVC for Quads?

By operating strictly under compression, smaller pipe can be used for a
quad than for free standing structures. Again, protection from UV exposure
is a must. Fiberglass tubing offers much better strength to weight ratios
for this application.

PVC *can* be used outside, but there are better materials. Fiberglass
tubing is better. Plumber's delight all metal construction is better.
Even bamboo is better. PVC pipe has the advantage of being cheap and

widely available. All metal construction, such as the popular J-pole made from copper plumbing pipe, is an excellent antenna solution. It not only has good strength, but it also offers a direct ground connection for lightning protection. This is usually missing from designs that depend on insulating materials for structural support.

1513. HR2610, need freq expansion mod

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-31 13:40:09 UTC
From: russell@cbnewsd.cb.att.com
Message-ID: <1992Jul31.134009.14222@cbnewsd.cb.att.com>
Source record: 286499

I am posting this for a friend. I am not familiar with the HR2610.

I am looking for mods for the Uniden HR2610. In particular, a mod to
expand the operating frequency range. I have looked at
garfield.catt.ncsu.edu, but did not see any mods for this radio there.

Thanks,

>
>I read "Vertical Antenna Handbook", by Capt. Paul H. Lee,
>CQ Publishing Inc. The author says "vertical antenna does
>not cause more TVI and BCI than horizontal antenna" in his
>book in p.126.
>
>Is it true ?
>
>I think vertical polarization wave causes more common-mode
>interference voltage in TV antenna feeder.

You are both correct, with qualifiers. In the far field, the vertical will tend to have more common mode coupling with vertical feeders. In the near field, the situation is so complex that it may or may not make a difference. In the very near field, transformer coupling takes place and again the vertical will couple better to vertical feeders. After passage through the ionosphere, it doesn't matter since the wave will come down with arbitrary polarization due to Faraday rotation.

I'd say that unless the antenna to feeder spacing was on the order of <.2 wavelength or >10 wavelength, the near field structure is so complex that it's impossible to decide which is worse. Skywaves are usually a non-issue in TVI.

The MAR6 is an wide band amp up to 2 GHz.
Gain about 20 dB, 3rd order intercept point 15 dBm,
16 mA with 3.5 volts

Connection 1 (with the dot) is input
2 and 4 are ground
3 via RFC to plus 3.5 volts or via RFC and 560 Ohm to 12 volt.

|> type or vintage of these rigs. Did Collins survive until the digital
|> age?

I am not an expert on Collins gear, but I've been the proud owner of a fair amount of it, so I'll take a shot. The earliest Collins equpiment that I remember was the 32v? and 75a? where the ? is a single digit in the range of 1-4. I don't remember a 32v4, but there might have been one. These were built in the early 50's (and probably in the 40's too). The 32v3 (for instance) was an am and cw transmitter. It was a real work horse. The 75a4 was the last of the "a" series receivers. It was one of the b

est for its time. I think the first ssb transmitter that Collins marketed in the 50's (if not the first, one of the first) was the kws-1. It was a kilowatt ssb transmitter. It was primarily a companion to the 75a4. In about '58 Collins designed the s-line series of transmitters/receivers starting with the 75s-1 and the 32s-1. These rigs were designed as ssb/cw radios. They used mechanical filters to provide the best (for the time) bandpass filters available. Compared to the older Collins gear these

were lightweight, compact and efficient radios. They were amateur band only, but by replacing the (plug-in) crystals in the radios you could cover almost the entire 3-30 megacycle band (no hz in those days 8^). Another feature that I think was a first, was that they could be interconnected so that they would transceive. The transmitter was controlled by the receiver's pto (vfo, in generic terms). That way you didn't have to "zero beat" your transmitter to your receive frequency before transmitting. T

he 32s-1 had a pair of 6146 tubes in the final and would put out about 100 watts.

In later years Collins updated the s-line series to include a 75s-3 and 32s-3. The 75s-3 seemed to be more popular. I guess they must not have made as many improvements. I just remember a lot of people running a 75s-3 and 32s-1 together.

The kwm-2 was a design that was a marriage of the s-line equipment. It was built in the same style of the s-line. The cabinet was just a bit larger (deeper) than the s-line units. (The 32s-1 and 75s-1 shared the same cabinet design. Their skins were interchangable) It was a true transceiver as we know them today. Like the 32-s1, it had a pair of 6146's and ran about 100 watts output. It was generally promoted as a mobile radio and there was a mobile power supply that bolted to the back of the radio.

These were all tube radios and needed 800 and 300 volts, in addition to the 12 volts from the car to run.

The kwm-1 was a predecessor to the kwm-2 and, maybe, the s-line. It was a 20-15-10 meter band mobile rig. I don't remember much about them, except that they were not as popular as

the "m-2", as the kwm-2 was generally known.

The 30s-1 and 30l-1 were two linear amplifiers in the s-line family. The 30s-1 was a real brute and could put out well over the legal limit. It had a floor mounted cabinet that contained the power supply. The amp itself usually sat on top of it. The 30l-1 was a smaller linear that used a pair of 811(A) tubes. It was rated at something less than a kw, but I don't remember the exact specs. It was a desktop unit that looked a lot like the 32s-1. It may have had the same skins, but my memory is hazy. I

t was a lightweight, but rugged (not physically, but electrically) linear. In later years, I have heard of people putting 572b tubes in the L-1 and getting a solid kw (input).

The first solid-state radio that Collins put out was the KWM-380 (at least that was generally used by hams). I believe that this came out in the mid-70's. The price tag was about $3500 at the time, and it was generally believed that the radio was not as good as the kwm-2a. I think it was improved over the years, but due to that preception and the high price tag, Collins never had the success with the kwm-380 that they did with their s-line and m-2 lines. About that time, I think Collins was having trou

bles and seemed to abandon the amateur market. Rockwell bought them out sometime after the introduction of the kwm-380 and it seemed like they gave up on amateur radio. These are just my perceptions, I had moved from Iowa by then and lost my contacts in Cedar Rapids.

Another less popular member of the s-line family was the 51s-1. This was a general coverage receiver. It looked a lot like the 75s-1, but was a little different interally.

Also available were accessories such as the 312b-1 (right number?) console
that had a watt meter (forward and reflected power), speaker and phone patch. The 612s-1 (I know that isn't the right number) transverter that was used to work 6 and 2 meters. There were some others, but I don't remember them.. I think there was an external vfo for the kwm-2, but I haven't seen one for years. With that the kwm-2 had most of the functionality of the the separate s-line twins.

I understand that the kwm-380 is still available at a very high price. I heard $30,000. And that you have to have one built, they don't stock them. All of this could be rumor, however.

That is what I remember. Please don't flame me for a lousy memory!

>monitor at home that plays HAVOC with the ENTIRE 10M novice SSB portion

He said "telephone handset", not radiotelephone. I did, once, see RS-232
lines interfere with a telephone, but they were strung together in the same
25-pair cable for about 200 feet...

>>Indeed, the whole lot is FCC Class B certified. I doubt you could say
>>the same for Suns or ATT workstations.
>My PC is class B (including the monitor, I think - now I'm going to
>have to check!), but that does not alter the fact that 10m is pretty
>much useless when I have the computer on...

A lot of PC's aren't checked thoroughly for whether or not they really meet
the emission specs, and they are frequently checked with configurations that
aren't shipped (special shielded cables, no external devices save the monitor
and keyboard, etc), resulting in real-world systems coming nowhere near meeting
the class B specs; also worth noting is that the class B rating doesn't promise
that a sensitive shortwave set won't be completely wiped out, only that Aunt
Edna's Dumont TV isn't likely to be...

1523. Upcoming DXAC vote on DX Operating Practices

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-31 16:01:14 UTC
From: reisert@mast.enet.dec.com
Message-ID: <9207311601.AA02203@enet-gw.pa.dec.com>
Source record: 286492

[NOTE: Bill made a mistake in his description of working by call areas.
I have made the necessary corrections, enclosed by []. - AD1C]

DX-Operating Practices

The DXAC has been asked to vote on accepting the report on
operating practices on August 24. The subcommittee has worked
since 1990 to formulate a response to an ARRL BoD request to
research and recommend disqualification criteria for
DX-Peditions (sic). This request is based on concerns expressed
in the March 90 QST. The subcommittee is chaired by VE3HO, and
its members are K4MQG, K5YY, NA2M (replacing W2MT), W4VQ,
and W6CF. The report is lengthy, so there is obvious risk of
misunderstanding for me to attempt to summarize its main
points. Suffice it to say that this report is well-organized and
clearly written. It is evidently based upon careful consideration
of what is a complicated set of problems and an equally
complicated set of possible solutions. While some may object to
some of the conclusions, the subcommittee deserves everyones
thanks for tackling a thorny set of problems and doing a
professional job in presenting their suggestions.

The following are some of the highlights of the report:

1. DXCC Rule 12, Operating Ethics, provides a mechanism for
applying sanctions to individuals or DXpeditions who exhibit poor
operating practices, and that new disqualification criteria for
DXpeditions are NOT required or desirable at this time.

2. The DXAC shares with the BoD the concern that malicious
interference on the HF bands associated with major DXpeditions
is not desirable and is detrimental to the future of the amateur
radio service.

3. Operating Band Plan: This part of the report deals with the
possibility of an amendment to the band plans that recognizes
the need for designated space for DX-split frequency operations.
SSB and CW DXpedition and listening frequencies are suggested
for amateur bands 10 through 160M. Consideration is taken of the
operating privileges of US DXers with different classes of
licenses. No suggestions are made for RTTY. (There are no
surprises here insofar as I can see. Frequency ranges and options
correspond to those typically used by DXpeditions.)

4. Operating Practices and Procedures: This section is a
synthesis of the techniques and practices that most would agree

good DXpeditioners and successful, considerate DXers follow. Several ARRL publications summarize many if not all of these, but the report will serve to call attention to them.

When working by call areas, the recommendation to the DXpedition operator is to ignore portable designation and recognize only call sign prefix numbers. For example, if KC1AG were in San Diego he would call with the [W1s] not with [W6s] or BOTH the W1s and W6s. The report states this particular recommendation is likely to be controversial. However, they point out the rampant abuse of the portable designation as the rationale for their suggestion. (Any comments?)

5. Equipment Manufactures: The report suggests the ARRL takes steps to recommend to manufacturers that technical means be developed to prevent inadvertent out-of-band and off-frequency transmissions (e.g., transmitting on the DXpeditions XMIT frequency.)

6. Enforcement and Education: As the report states, ...malicious interference can to some extent be reduced by increased peer pressure against such undesirable behavior and by more refined enforcement techniques. Also suggested are educational programs to help all amateurs understand proper operating techniques for both DXpeditions and those attempting to work them; mechanisms to provide public recognition to those who exhibit superior and ethical operating techniques, etc.; and development of a mechanism of alerting the ARRL FCC Auxiliary Corps of major DXpedition activity.

Due to the length of the report and the wealth of detail it contains, I hope that this report will be published in QST and thus be open for broad discussion. It deserves everyones attention. I am also sure the subcommittee appreciated the comments those on the YCCC PacketCluster submitted.

73, Bill Shipp KC1AG, NE Division DXAC Representative

This is a good idea. Since control of the bands is mostly in the hands of the DXpeditioners, they are the ones who need to be educated. Educating the people calling in the pileups is important, but secondary. To wit, the 3Y5X operation was pretty much a joke, save for when F2CW was at the key. As long as the DXpedition is making QSOs, it is a success, no matter how much boorish behaviour the callers are able to muster.

Rampant abuse? I suppose the only possible way to really abuse the portible designation would be for me to sign WN4KKN when they are taking 4's, WN4KKN/5 when they are taking 5's, WN4KKN/6 when they are taking 6's, etc. If this is the type of abuse that people are concerned about, the DXpedition people need to find a better hash than "call area."

Going by call areas is a poor operating practice in general, and asking K4TKM/6 to whip all the W4's to contact Egypt is absurd. A much better practice is to hash things geographically, such as "QRZ North America" or "QRZ Europe." Once again, this is really only an issue for bad ops who travel. These are the ones wasting everyone's time taking the callers to task rather than simply getting the job (of making QSOs) done. The good DXpedition op doesn't waste his time arbitrating; he just works guys.

> 6. Enforcement and Education: As the report states, ...malicious
> interference can to some extent be reduced by increased peer
> pressure against such undesirable behavior and by more refined
> enforcement techniques.

Blah blah blah. It's the ops who go on the DXpeditions who are the root of most of the problems. What is the League going to do, have sanctions against lids who go on DXpeditions? As I heard George Fremin (WB5VZL) once say: "*Anyone* can go on a DXpedition." And he's right.

1525. PRO scanner anomally

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-31 16:04:20 UTC
From: pitonyak@cis.ohio-state.edu
Message-ID: <1992Jul31.160420.10131@cis.ohio-state.edu>
Source record: 286502
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc

I was scanning with a realistic scanner (the exact model escapes me but it was the top of the line hand held model) when I noticed that I could hear 147.24 mhz up at 168.64 mhz. On further investigation I found that in that approximate range I could receive most of the two meter bands at their regular spots as well as 21.4 mhz above where they should be.

I was able to over power 162.55 by transmitting on 141.15 mhz. Is this inherenet in any other scanners? Should this annoy me?

You will be able to operate on two meters in Europe. Their band plans
are a little different and the radios are a little different- many
repeaters need some kind of tone for access. If you look in the
operating manuals for gear, there usually is a different version of a
radio for use in Europe. You should request some info. from the
manufacturers about the differences in the radio version and the
possibility of getting a foreign spec. radio which will also work here.
(A problem could be that the FCC would not have approved the rig for use
here)
In the countries you mentioned, you should be able to get reciprocal
licensing. It should be a matter of filling in some forms and waiting.
Write the ARRL for details- their address should be in one of your study
books.

Take care-

While the above correctly describes the 'K4' mod, I must report that an unwanted side affect is that K4 does not support 'on-air cloning' (see below). If all you really need is MARS/CAP, and you still want the 'cloning', then I recommend the 'K3' mod.

-fred

The following information came from Kenwood:

MODIFICATION MATRIX FOR TM-732A

Resistors TX Ranges STD Has
M 22 21 20 19 VHF UHF SHIFT 800 Remarks

K1 0 1 0 1 144-148 438-450 .6/5 Std. US Version
K2 1 1 0 1 144-148 438-470 .6/5 x US After green wire cut
K3 1 0 0 1 142-152 420-470 .6/5 x MARS/CAP Mod
K4 0 1 1 0 136-174 410-470 .6/5 x All Band Mod
M1 0 0 0 0 144-148 430-440 .6/5 Generic Int'l Model
M2 0 1 0 0 136-174 410-470 .6/5 x All Band Int'l (430 default)
E1 0 0 1 0 144-146 430-440 .6/(1.6) Std Europe Model
E2 1 0 1 0 136-174 432-438 .6/1.6 x Denmark
E3 0 0 1 1 144-146 410-470 .6/(1.6) x
E4 1 1 0 0 144-146 430-440 .6/(1.6) x
E5 1 0 1 1 136-174 410-470 .6/(1.6) x Europe All Band
C1 0 0 0 1 136-174 340-512 5.7/10 China Model

0 = Resistor IN 1 = Resistor OUT

Notes:

1. All "resistors" 0 ohms (wire jumper OK)
2. Green wire is equivalent to R22 - present in K1 model
3. 0 = resistor present, 1 = resistor absent
4. Standard shifts in MHz. Those listed as (1.6) also do -7.6
5. Codes not listed are used in Japan version, special CPU required
6. M column is factory MODE number
7. K2 Mod includes 410-470 RECEIVE and enables CLONING features

To perform any of these mods, remove the back cover from the remote head unit. Resistor numbers clearly marked on board along top.

800 MHZ RECEIVE

To enable 800 receive, switch to UHF VFO (not available in UxU), press and hold MHZ button until 800.000 appears.

A capacitor must be added (C348) to enable the 800 receiver. To add, remove UHF transciever board and next to the pad of pin 1 of IC-202 (on the foil side), add a 2.2 pF chip capacitor. A wire can be used instead of the capacitor but sensitivity will be reduced. (See schematic diagram for reason).

HARD-WIRE CLONING (Works in all confguration modes)

This procedure allows you to clone the entire memory of a "master" transciever into the memory of a "slave" transciever.

First, construct an RJ-45 Jumper cable as follows:

```
------| |------
UP ---------------------------- UP Note that PTT and DOWN
E ----------------------------- E are crossed end-to-end
PTT ----------------------------- DOWN
DOWN ---------------------------- PTT
------| |------
```

For hacker's reference: UP=CLK, PTT=SO/, DOWN=SI

1. Configure the master transciever's memories as desired.

2. Switch power OFF, hold down F and MHZ keys and switch power back on while holding keys. Display will show "CLonE".

3. Set the slave transciever in the clone mode (as in step 2).

4. Plug the cable into the two radios (which end does not matter).

5. Press the CALL button on the master. When "End" is displayed, operation is complete.

ON AIR CLONING (Does not work in K1 or E1 Mod modes)

This procedure allows you to clone a second transciever as above, over the air. The data is transmitted automatically using DTMF tones. During transmission (which is one-way only), the master

will automatically switch to LOW power. To be legal, use only a UHF cloning frequency.

This procedure is not enabled in the stock transciever. At a minimum, you must cut the green wire to make it work.

1. Configure master transciever's memories as desired. Select a UHF simplex transmit frequency and set PTT to UHF (will work on VHF but is not recommended).

2. Switch the power OFF. Press and hold the CALL and DTSS buttons and turn the power back ON. "CLonE" appears in display.

3. Set the receive frequency on the slave transciever the same as that of the master. Turn power OFF, hold down CALL and DTSS keys and turn power ON. "CLonE" appears in display.

4. Press the PTT on the master's microphone. Data transmission will begin. In case of a receive error, the slave transciever will display "Err". When the procedure is complete, both radios will display "End".

THE FOLLOWING FEATURES ARE UNVERIFIED, SO
YOU MAY NEED TO EXPERIMENT FOR YOURSELF

PAGING ANSWERBACK (Does not work in K1 or E1 Mod modes)

The exact operation of this feature is unclear but the following description has been given:

1. To enable, hold down the F key and press the TONE key.

2. Do disable, repeat step 1

When enabled, documentation says: "If a matching code is received and the other transciever is no longer BUSY, the code of the local transciever is sent to the other transciever. The answerback function then turns off."

MEMORY RECOVERY (requires DTMF microphone)

(Documentation of this "feature" is difficult to comprehend but perhaps someone will figure out what it does.. I suspect that "RECOVERY" refers to returning the memories to their original state after changing the split memory layout.)

1. Hold down F and C.SEL, turn on power

2. Press D, followed by 7 on the microphone. "Inspection Mode" is now enabled.

3. To cancel, press and hold F and then C.SEL

"Note: Before recovery, the memory channels must be returned to the previous state (number of split memories, etc.)."

ZCZC AE03
QST de W1AW
DX Bulletin 40 ARLD040
From ARRL Headquarters
Newington CT July 31, 1992
To all radio amateurs

SB DX ARL ARLD040
ARLD040 DX news

Thanks to Paul, KB1BE, and the Connecticut DX Association for the following DX information.

BANGLADESH. Saif, S21A, is active on 20 and 15 meter SSB around 1600z. He has been on 21281 and 21335 kHz listening up, and also with the 14256 kHz group later in the day. QSL via W4FRU. Erik, WZ6C, and other operators, both Nationals and foreigners, are expected on the air soon.

FROM THE DXCC DESK. Questions are being asked at the DXCC Desk about the status of S2/WZ6C and S21NQ cards. These cards are not currently acceptable for DXCC purposes. Should retroactive documentation be received for these operations, there will be a News Release from the DXCC Desk and a W1AW bulletin.

ANGOLA. Rudi, DK7PE, is now signing D2CW and is very active on all bands with CW. QSL to his home call. D2FGC has been running stations both on SSB and CW. QSL via OK1AJN.

BENIN. TY1IJ is now active. QSLs go via DJ5IO.

PACIFIC DX. Peter, DK6NP, will be on a summer trip from August 1 through 26. He expects to sign A35NP, 5W1NP and 3D2NP.

WAKE ISLAND. Ken, KK4DK, will be on the island until September 1. He operates CW, SSB and RTTY. QSL via OKDXA, PO Box 88, Wellston, OK 74881.

JERSEY. Hank, PA3FWU, will activate Jersey as GJ/PA3FWU on 80 through 10 meters, including the WARC bands, between July 31 and August 8. QSL to Box 268, 3940 AG, Doorn, The Netherlands.

NORTH COOK. Look for ZK1AR starting August 5. This operation is planned to last one week.

SOLOMON ISLANDS. Local radio amateurs will operate H44GC from 0800z Friday, August 7 until 0800z Sunday, August 9 to commemorate the 50th anniversary of the battle for Guadalcanal. The operating site

will be from an old base known as Fighter Two. SSB frequencies will be around 7080, 14280, 21380 and 28480 kHz. Look for CW activity 40 kHz up from the bottom of the 40, 20, 15 and 10 meter bands. For a QSL, send an SASE to K2PF.
NNNN

/ hplsla:rec.radio.amateur.misc / penfold@crchh344.bnr.ca (Harvey Schwartz) / 11:56 am Jul 30, 1992 /

When both volume levels are turned all the way down and the squelch is set to a normal operating position, and a qso is taking place on a repeater on vhf, I can hear popping noises whenever the repeater is accessed. I suppose this could happen on uhf also, but I haven't noticed it yet.
Has anyone else noticed this phenomenon, and is this a bug in the design?

I've noticed that when I'm monitoring VHF, with the UHF volume turned down, that I'll hear noises as UHF breaks squelch. Not normally noticable unless the UHF signal is marginal, causing frequent squelching.

By the way, has anyone other than myself noticed that frequently a button press/dial turn is missed? Is this a bug in the design?

I apologize for the previous post. I was using an unfamiliar editor and
didn't realize it was not inserting returns at the end of line.

In article <110@microm.UUCP>, brad@microm.UUCP (Bradley W. Fisher) writes:
|> I'm interested in learning more about the Collins line of ham gear.
|> Can anyone point me to (or summarize here) some documentation on
|> the various models and their features. I keep hearing of references
|> to "s-line" , or "KWM-2A" and such but really have no idea as to the
|> type or vintage of these rigs. Did Collins survive until the digital
|> age?

I am not an expert on Collins gear, but I've been the proud owner of a fair
amount of it, so I'll take a shot. The earliest Collins equipment that
I remember was the 32v? and 75a? where the ? is a single digit in the
range of 1-4. I don't remember a 32v4, but there might have been one.
These were built in the early 50's (and probably in the 40's too).
The 32v3 (for instance) was an am and cw transmitter. It was a
real work horse. The 75a4 was the last of the "a" series receivers.
It was one of best for its time.

I think the first ssb transmitter that Collins marketed in the 50's
(if not the first, one of the first) was the kws-1. It was a
kilowatt ssb transmitter. It was primarily a companion to the 75a4.
In about '58 Collins designed the s-line series of transmitters/receivers
starting with the 75s-1 and the 32s-1. These rigs were designed as
ssb/cw radios. They used mechanical filters to provide the best
(for the time) bandpass filters available. Compared to the older Collins
gear were lightweight, compact and efficient radios. They were amateur
band only, but by replacing the (plug-in) crystals in the radios you
could cover almost the entire 3-30 megacycle band (no hz in those days 8^).
Another feature that I think was a first, was that they could be interconnected
so that they would transceive. The transmitter was controlled by the
receiver's pto (vfo, in generic terms). That way you didn't have to
"zero beat" your transmitter to your receive frequency before transmitting.

The 32s-1 had a pair of 6146 tubes in the final and would put out about 100 watts.

In later years Collins updated the s-line series to include a 75s-3 and 32s-3. The 75s-3
seemed to be more popular. I guess they must not have made as many improvements. I just
remember a lot of people running a 75s-3 and 32s-1 together.

The kwm-2 was a design that was a marriage of the s-line equipment.
It was built in the same style of the s-line. The cabinet was just a
bit larger (deeper) than the s-line units. (The 32s-1 and 75s-1 shared
the same cabinet design. Their skins were interchangible) It was a
true transceiver as we know them today. Like the 32-s1, it had a pair

of 6146's and ran about 100 watts output. It was generally promoted
as a mobile radio and there was a mobile power supply that bolted to the
back of the rig. These were all tube radios and needed 800 and 300 volts,
in addition to the 12 volts from the car to run.

The kwm-1 was a predecessor to the kwm-2 and, maybe, the s-line. It was a
20-15-10 meter band mobile rig. I don't remember much about them,
except that they were not as popular as the "m-2", as the kwm-2 was
generally known.

The 30s-1 and 30l-1 were two linear amplifiers in the s-line family.
The 30s-1 was a real brute and could put out well over the legal limit.
It had a floor mounted cabinet that contained the power supply. The
amp itself usually sat on top of it. The 30l-1 was a smaller linear
that used a pair of 811(A) tubes. It was rated at something less than a
kw, but I don't remember the exact specs. It was a desktop unit that
looked a lot like the 32s-1. It may have had the same skins, but my
memory is hazy. It was a lightweight, but rugged (not physically,
but electrically) linear. In later years, I have heard of people
putting 572b tubes in the L-1 and getting a solid kw (input).

The first solid-state radio that Collins put out was the KWM-380
(at least that was generally used by hams). I believe that this came
out in the mid-70's. The price tag was about $3500 at the time, and
it was generally believed that the radio was not as good as the kwm-2a.
I think it was improved over the years, but due to that perception
and the high price tag, Collins never had the success with the kwm-380
that they did with their s-line and m-2 lines. About that time, I think
Collins was having troubles and seemed to abandon the amateur market.
Rockwell bought them sometime after the introduction of the kwm-380
and it seemed like they gave up on amateur radio.

These are just my perceptions, as I had moved from Iowa by then and
lost my contacts in Cedar Rapids.

Another less popular member of the s-line family was the 51s-1.
This was a general coverage receiver. It looked a lot like the 75s-1,
but was a little different interally.

Also available were accessories such as the 312b-1 (right number?) console
that had a watt meter (forward and reflected power), speaker and phone patch.
The 612s-1 (I know that isn't the right number) transverter that was used to
work 6 and 2 meters. There were some others, but I don't remember them..
I think there was an external vfo for the kwm-2, but I haven't seen one for
years. With that the kwm-2 had most of the functionality of the the
separate s-line twins.

I understand that the kwm-380 is still available at a very high price.
I heard $30,000. And that you have to have one built, they don't stock
them. All of this could be rumor, however.

That is what I remember. Please don't flame me for a lousy memory!

I'm for drilling a hole. I have the bits, the drill, the courage, etc.
What I don't have is knowledge of how to bring the coax down to the radio
without an all-day job of dropping the interior upholstery, or worse yet
having a hole in the upholstery with the coax stringing through it. Any
hints/shortcuts?

Your guess is as good as mine (probably better) as to which, if
any, of these is the Arthur in question :-)

I did not check for any Arthur AndersOn's...

> Does anyone know if it will be possible
> for me to transmit with my 2m radio? Will I need to get a license in the
> country that I end up in? Do they even use 2m in Europe?

A reciprical license is required in most countries and the ARRL is a good
source of info regarding that aspect.

> You should request some info. from the
>manufacturers about the differences in the radio version and the
>possibility of getting a foreign spec. radio which will also work here.
>(A problem could be that the FCC would not have approved the rig for use
>here)

As for FCC approval of radios for ham use; no approval or type certification is
required. The individual ham has the responsibility for the radio to meet and
be used in accordance with part 97 requirements.

I am expecting to take another trip to Alinco later this year. You may recall
that I went last December. At that time I shared information that was contained
on info-hams / internet. I am offering to do this again. Your comments have been heard and
will continue to do so.

What features would you find useful in a handheld ?

It has been said that more memory channels, pluggable memory,
design and general coverage would be nice.

What do you folks in hamland think? It appears that dual mode walkies
are an embraced item by hams and are here to stay. What options have we
yet to see in a walkie or mobile? Let your mind wander and let me know
what you come up with. All ideas will be shared with Alinco on my next
trip. Please send your comments to me at: Jay_Appell@cac.stratus.com
or on ONE HOPEDALE CENTER 508-478-6969 BBS running from 7am to 9pm et.

Regards,

Jay (KA1SNA)

1541. Info on Collins models wanted

Newsgroup: rec.radio.amateur.misc

Source record: 286429

>I'm interested in learning more about the Collins line of ham gear.
>Can anyone point me to (or summarize here) some documentation on
>the various models and their features. I keep hearing of references
>to "s-line" , or "KWM-2A" and such but really have no idea as to the
>type or vintage of these rigs.

KWM-2 and KWM-2A are transceivers. S-Line was the name for the entire amateur product family in general but usually refers to the separate transmitter (32S-...) and receiver (75S-...). A 30S-1 is a desktop linear amplifier, and the 30L-1 is the 1 kW input, high duty cycle amplifier.

A KWM-2 covers the amateur bands of the day (28.5-28.7 on 10 m with 2 blank crystal sockets for 2 more 200 kHz ranges of your choice), and the KWM-2A has a second crystal deck for doubling the number of 200 kHz ranges covered.

There is a Collins Collectors Association and a Collins Collectors Net on 14263, but the Cedar Rapids newsletter only has a reference to the publisher being Jay Roman, KB0ATQ. Bill Wheeler, K0DEW, is also mentioned as being involved. I don't have any more details on this group. Address for more information is Collins Collector's Magazine, 2465 W. Chicago St., Rapid City, SD 57702.

Probably need to find some back issues of QST in the 60's and 70's for ad copy on the KWM-2( ) and the S-Line products.

One of the past Cedar Rapids newsletters outlined some of the various projects that had been proposed in the amateur product line and dropped. Some of the more documented ones included a 30S-3 auto tune amplifier, a KWM-5000 with 2 VFOs (would have been kind of like the Signal/One transceiver overall) - conceived 27 May 1960. A station console with an antenna selector switch, rotator control, and a "digital" (tumblers) clock was proposed, but it wasn't built for production - there are pictures of a station with the console in the display. The TMT-1 was a transistorized mobile HF transceiver proposed in the mid '60s and in the early 70's a KWM-3 was proposed (the artist's sketch shows the concept to look a lot like the 651S-1 receiver). The KFM-1 was conceived about the time the KWM-380 was being planned and was a 2m FM transceiver (picture shows frequency programming done with a card - punch out holes corresponding to the frequency you want.). Rod Blocksome, K0DAS, is mentioned as always being on the lookout for "almost was" trivia.

>Did Collins survive until the digital age?

Sure. The KWM-380 amateur transceiver (and HF-380 general coverage unit) were brought out in the late 70s. Collins Radio Company was bought by Rockwell International around 1971. So the places are still here but just not in the Amateur Radio business (for now anyway - if there's going to be

some major bucks in amateur radio again, i wouldn't be surprised to see something develop). One of the reasons for the success of the KWM-2 and S-Line family was that the radios were universal - everyone could use 'em. However, time marches on and radios just aren't as interchangeable between different services as they once were. Hams can't afford to buy gear at or near Mil-Spec, commercial users don't need the frequency agility, and the Military's into secure communications (sort of the opposite of what us hams do) anyway. <insert your reasons here>.

Next year is the 60th anniversary of Collins Radio (1933 to 1993) and 1994 is the 20th anniversary of the Melbourne Operations plants (originally built to make panel mount avionics for light and medium sized aircraft). I believe that every place that has a tie to the old Collins Radio will be doing something - certainly a special event station or two.

Unfortunately, I've heard of cases where folks have questioned 911 calls!

>>>>If it doesn't justify a call to 911,
>>>>it isn't an emergency.

Ok, maybe, but what if 911 is not the best (for some value of best)
way to get help?

>>If you break down 70 miles into the desert, there's no cellular service,
>>no passing vehicles for the last two days that you can flag down, and
>>the buzzards have started to circle, you still shouldn't call a commercial
>>towing service. You should call the Sheriff's Rescue Unit. It's not an
>>emergency unless you need emergency services personnel.

Hmm. I'm sure I've missed the repost of the appropriate section of
the FCC rules (:-), but I seem to recall that the verbiage had
to do with risk to property or life, not necessarily an emergency,
and also note that the FCC definition of "needing to use for help"
may NOT be the same as the 911's definition of "needing to use for help"
(in fact, that article in QST recently on use of autopatch said that
I should NOT use the autopatch to call in a person going 90 on the
freeway (speed limit 55), whereas 911 would most likely be the
number to call were you at an appropriate phone - but note that
this was the ARRL's definition of autopatch "fair use").

>I'd suggest that your definition of an emergency is very limited and
>not in sync with what most hams would apply in a common sense view.

Actually, as already stated, I think getting off on defining "emergency"
looks a lot like a rabbit to chase (i.e. that is probably not the point
here).

>... are always a potentially dangerous situation. If the
>"breakdown" does not require medical attention then why call 911
>and place greater time and resource burdens on those folks. Call
>the tow service, AAA or whatever.
>

> Anyway, I understand and respect your opinion,
>but it is not what I would do in a strictly mechanical breakdown
>case.

As Phil stated very well (something about what the regs do and don't
say) - while the regs may not state one way or the other, I agree
with Bill here. (Assuming the attributions are right :-)

>
>>>Now, how simple can you get! It didn't list any exceptions ....
>>

Not there. How about the "use anything at your disposal if life
is in danger" clause? (For the legal eagles here, that is a very
rough interpretation of my understanding of the rules as they
relate to emergency communication.) I believe that the "emergency
use" clause basically overrides the restrictions here. If I
were on a patch making what I considered an emergency call
and got put on hold with music, I'd stay on the line. If it
were NOT an emergency call, I'd hang up immediately (possibly
retrying the call but informing the person doing the hold that
I could not be put on hold due to FCC rules, or some such
nonsense :-). If someone terminated the call on me, I'd

(1) write down their callsign (assuming it was given - if the
person doing such a thing does not id, then all their
posturing about wanting to ensure legal operation is just
that - posturing (i.e. pure bull))

(2) re-initiate the call, but this time with a key so
nobody other than the control op could take the patch down.

(3) after it was all over, notify the FCC (or other
appropriate entity) that said person interfered with
what I considered an "emergency" phone patch.

Oh, ok, I'll go crawl back into my hole :-)

>amp itself usually sat on top of it. The 30l-1 was a smaller linear

The power supply and amp were physically connected. Fortunately, you could remove the 80# power transformer for "ease of shipping" (they were shipped from the factory this way). You could also mount the 516F-2 power supply (for the transmitter/transceiver) inside the base of the 30S-1.

>that used a pair of 811(A) tubes. It was rated at something less than a

Four 811's...lightweight? Yeah, compared to the 30S-1 ;-). They'll put out about 500-600W, depending on how red you like your plates ;-).
You're right, the 30L-1, 32S-1, 75S-*, and KWM-2A were all the same size and general appearance.

/\

ADMINISTRATIVE BULLETIN

31 July, 1992

New and Upgraded Software Released

/\

NEW AND UPGRADED SOFTWARE RELEASED AND AVAILABLE THROUGH ANONYMOUS FTP

Version 1.02 of the BCAST software package has been released and is now
available through anonymous FTP (filename: "BCAST102.ZIP"). This Solar and
Geophysical Database Management and Analysis Software is designed to
automatically extract, archive, interpret, and analyze all of the values
contained in the daily Solar Geophysical Data Broadcast (SGDB) reports which
are posted to the nets.

This newest release contains substantial enhancements and new utilities.
It also contains information on a new subscription service to provide
mailings of 5 1/4" 1.2 MB or 3 1/2" 1.44 MB disks each quarter (March, June,
September, and December) containing solar and geophysical information and
supplementary material.

New WARNINGS and ALERTS have been added to the SGDB reports. Only
version 1.02 of this BCAST software will properly handle these new warnings
and alerts. This software is therefore highly recommended for those who are
using BCAST to properly interpret the SGDB reports.

This release of the BCAST software is available through anonymous FTP
from one of the following anonymous FTP sites:

solar.stanford.edu <--> "pub/Software"

1546. Search for a Gel Cell battery

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-31 22:30:56 UTC
From: cscon0151@uoft02.utoledo.edu
Message-ID: <1992Jul31.173056.9094@uoft02.utoledo.edu>
Source record: 286504

I'm looking for gel cell battery that can safely handle a 25 amp draw (12VDC), any ideas where to purchase one new and appx. how much? (Don't trust a car battery!)

Brad

>having a hole in the upholstery with the coax stringing through it. Any
>hints/shortcuts?
>Vern Eubanks, AA7EI

Something that I've seen a lot of lately is people putting NMO mounts in their car's roof by locating the hole immediately above the dome light. While not all cars have dome lights these days, those that do usually have a wire channel which leads across the roof over to the nearest door frame and then down inside the frame. The good news is that most headliners today actually _come_ out in one piece, however it's seldom necessary to take it all the way out. You just need to pull it down far enough to stick your forearm inside, only to find out that there is a lot of sharp metal underneath all that pretty interior trim. Choose your curse words wisely as by this time your wife is probably staring in amazement, too shocked to speak at at the sight of what you've done to the family car.

From there, the main wiring channels are along the bottoms of the door frames and can usually be opened with just a couple of screws. Indeed, some cars these days will have only one or two screws holding the whole cotton picking interior together in a computer designed, interlocking scientific wonder. Of course it's all made from the very finest plastic available.

Often, the screws which hold the plastic panels in place are covered with handsome simulated plastic hole covers which have a pronounced tendency to break and/or disfigure as they are pried out with sharp implements. That's because they're the structural equivalent of a tie-wrap in that they're meant only to be installed and not removed. The solution here is to _first_ go down to your friendly auto dealer and pay a visit to their new car parts department. By all means, stock up on those little plastic trim plugs, and plan on buying at least two more than you need. Chances are better than even you'll end up needing them all.

For years I've used the PO style mounts, you know, the ones which are compatible with PL259 connectors. This seemed lika a natural since I always seem to have spare parts for these connectors. Well, some practical experience has now demonstrated that the NMO is by far the

best, and after all, it's what the pro's use. In addition, NMO appears to actually pass RF at UHF frequencies, not something you can say about the PO mounts.

Anyway, back to the job at hand. After you've washed the blood and knuckle skin off the headliner, it's time to find a place to mount the radio. Today's cars have a marked disadvantage when it comes to add-on accessories. It seems that there is absolutely no place in the cockpit these days where even a tiny mobile rig will fit. It's not much better with the remote head jobbies either, since even if you do find a place to put the head, you've still got the box to contend with.

Mounting radios in modern day cars sure makes one yearn for the good old days when a lot of interior parts were still made of METAL. On several occasions I've found what would otherwise be the perfect spot for a radio mount, only to discover that the selected spot under the dash was a foot from the nearest piece of metal. Forget about mounting directly to the plastic panel, as it's made of some space-age designer plastic (PVC) which needs special reenforcement just to support an ashtray.

Anyway, I'll now describe how I installed the radio in my 1991 Ford Explorer. First, I'm using the Kenwood TM-741. I bought the remote head mount kit and I mounted the control head on the front of the ashtray. I don't smoke anyway and so it's not a problem as far as getting hot ashes on the rig or otherwise obstructing the tray. It also has the nice side effect of being mounted on a slide-out tray which brings the radio head closer to my hand for mobile operating. I drilled 2 6-32 holes in the ashtray cover to hold the mount. There's absolutely no way that the adhesive backed velcro supplied with the head kit would ever work.

The radio body was finally placed under the seat on the passenger side. There, I drilled holes directly into the floorboard and secured the unit using self tapping screws. Next came power, which required that I run a pair of number 10 conductors down through the floor, under the body along the frame, and up to the battery. Naturally, there's no access to the firewall to pass the wires through on the inside.

So all in all Vern, I guess the real answer is that there is no easy way to install a mobile rig these days and no matter what you do it'll take you at least half a day to do it. Don't be discouraged, however, since once you do it there's plenty of enjoyment to be had operating it.

And P.S. I was never able to cure the problem of my rear windshield wiper spontaneously actuating whenever I key up at high power on 2M. I've sinced relocated the COAX, away from all other wires to no avail. I guess Ford doesn't want the state patrol fleet business either.

1548. Re: PRO scanner anomally

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-31 22:49:00 UTC
From: barkman@gamma.is.tcu.edu
Message-ID: <31JUL199216492522@gamma.is.tcu.edu>
Source record: 286505

All scanners that have a 10.7 MHz IF will let you hear things 21.4 MHz above the fundamental frequency. Double the IF of any scanner and you get the same result. This should not annoy you but transmitting on 141.15 MHz will annoy the military and the FCC if they hear you. Scanners like the PRO 43 and PRO 200x series with their high IF freqs eliminate images.

ADMINISTRATIVE BULLETIN

31 July, 1992

Minor Additions to the daily SGDB Reports

/\

MINOR ADDITIONS TO THE DAILY SGDB REPORTS

The daily SGDB reports contain a "WARNINGS" and "ALERTS" section. We
have recently expanded the list of acceptable warnings and alerts to include
the following:

NEW WARNINGS
----

*FORBUSH - Released if a Forbush decrease is expected (or observed)
sometime during the next 24 to 48 hours.
*SWF - Released if minor flare activity is expected to be strong enough
to produce ionospheric short wave fadeouts affecting HF signals.
*MAGPAUSE - Released if space environment conditions are expected to become
sufficiently disturbed to produce magnetopause crossings by
geosynchronous satellites.

NEW ALERTS

**GLE - This alert will be released whenever a Ground Level Event is
observed or reported following significant major solar flares.

**MAGPAUSE - This alert will be released whenever a magnetopause crossing is
observed by either the GOES-6 or GOES-7 geosynchronous
spacecraft.

1552. License Query

Newsgroup: rec.radio.amateur.misc
Date: 1992-07-31 23:25:44 UTC
From: paulb@harley.tti.com
Message-ID: <1992Jul31.232544.1015@ttinews.tti.com>
Source record: 286524

Yesterday, all my troubles seemed so far away....
Ooops, got sidetracked by a Beatle song. Take two!

Yesterday, I passed* my Element 1A (5 WPM CW) moving me up from
a Technician to a Technician Plus.

I asked the VEC whether I need a slash something at the end of
my call when I work HF. They said I didn't.

Then I said, well, I guess the FCC will send me a new
license in a few weeks reflecting my new operating class**.
They said: NO... you only have our (big, bulky) certificate
to prove it... carry it around with you.

Okay, I can believe the answer to the question. But,
is it true that they don't send me a new license that
sez: "Technican Plus" ???????????

And as long as I am asking you guys, I may as well ask:
"Do I need a slash something" when working HF. After all,
if their seccond thing sounds suspicious, may as well ask
about the first.

Footnotes:
* Okay, so I didn't just pass. I got 100% on the test.
Okay, so I didn't just get 100% on the test, I copied
all 5 minutes perfectly. I didn't mention it because
I am modest.

** Who sez I have no class ?-).

>You're right, the 30L-1, 32S-1, 75S-*, and KWM-2A were all the same
>size and general appearance.

It definitely had 4 fire bottles - with only two, I would have vaporized them. I ran mine at 1 KW input (remember that was the way transmitter power was measured and limited back then - 1 KW DC input, or the equivalent PEP for the funny new mode called SSB.) 1 KW gave me about 600 watts out, as I recall. This was circa 1964.

For those of you who've never seen an 811 in operation, you've missed something. The filliment is very bright, like a light bulb. And at full power, the plates quickly turn somewhere between a cherry red and a bright orange (depends on how brave you are). At slow CW speeds, you could actually copy by looking at the color of the tubes - they changed color that fast. You had to be really speedy at tuning up, however, or you'd melt them. (Remember "tuning up" - that was before broadband circuits and motorized antenna tuners...)

Source record: 286522

Has anyone tried AEA's AMTOR mod for the PK232? Does it make
a noticeable difference? (This mod replaces 4 resistors to
sharpen up the active filter. You lose 300 baud ASCII and
HF packet capability, due to the narrower filter.)

Those of us who have weak stations appreciate any and all whittling down of the competition. I like it when they go by call areas. I'd be even happier if they'd ask for "Six Bravo YLs". :-)

I do, however, agree with Trey's comment on the absurdity of asking someone to compete with other people who may have *much* better propagation to the DXpedition location. If the DXAC is going to set a policy on this, *please* have it indicate that people should call with the district they're actually in.

1556. Opinions on QST

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-01 00:37:56 UTC
From: jkearman@arrl.org
Message-ID: <360@arrl.org>
Source record: 286315

In rec.radio.amateur.misc, jkearman@arrl.org (Jim Kearman) writes:

>thread history deleted.

>Well, Dave I'm gonna post here. What do others think about the
>balance of general-interest vs technical articles? Technical
>articles with PC boards generate mail from readers requesting

Ed Hare writes:

;Jim, you are braver than I! My feedback is colored by the fact that I
;work here, but hey, we're hams too, and have personal opinions. All
;in all I like the balance. Perhaps the most important thing WE (ARRL HQ
;types) should keep in mind is that each QST issue ideally should have
;something that interests each member or reader. As long as I get something
;that fills my needs or interests I am willing to accept the reality
;that the stuff I don't like is for someone else. I will admit that
;
;I will take this one step further: tell me what you want to see in QST!
;What technical subjects? What kind of operating or other general-interest
;articles do you want us to do? What don't you want to see in QST? What
;have you liked or hated? Send email to ehare@arrl.org and I will pass it
;along to the QST decision makers. They have told me that they really want
;to know. Let's tell them. :-).

Okay, two HQ staffers will now wash their laundry in public.

Personal-opinion mode, flame-suit on.

I like to read construction-project articles. I am a member of
about half a dozen QRP clubs, but I think the HF CW QRP subject
has been covered. Campbell's recent article on a high-quality
direct-conversion receiver is an exception. We need to populate
the UHF and microwave bands, so I'd like to see more practical
stuff for those frequencies. We're always getting new readers,
so the occasional HF QRP construction project is appropriate.

Is anyone building UHF repeaters? An article on putting
together a 23-cm FM repeater would be interesting.

We can always stand articles on antenna construction, and
they're very popular. How about a Doppler VHF antenna, or
anything on DFing, transmitter hunting?

For general-interest articles, my favorites are those
where Amateur Radio plays an adjunct role to some other
activity, such as sea kayaking or hang gliding. Of

course, I'm reading the current crop of fiction pieces....
I usually like the profiles of famous hams. Some of
the "humor" stuff I could do without, as I dislike
humor that requires denigration of someone or some
activity. I figure we can do better than a cheap shot.

I think the general-interest/technical mix is about
right.

I have DXCC and operate contests. I have done lots of
public-service operating in the past. Still, I could
easily live without DXCC lists, voluminous contest scores
and endless Station Activities. I'd like to see about 2
pages per contest, with the top scores listed, photos
and soapbox. If we charged a small fee for each entry,
we could mail the results to all participants. If you
weren't in the contest, why do you care how anyone did?
Most of the serious ops know the claimed scores months
in advance, anyway.

Do you really care that I submitted cards for a DXCC
endorsement, and now have 292 countries confirmed?
And, frankly, the number of messages handled by anyone
is of no interest to me. Station Activities merely
fills in the space between the ads (this has GOT to
get someone worked up, Ed).

I like the ads. I know they help pay the freight, and it's
interesting to see what's available and how much it costs.

Even though I work here, I look forward to seeing the
advance copy of QST each month. As you know, Ed, if you
have an article or column in that issue, you get an
advance copy. That's a real incentive to keep writing
for QST!

And that's my opinion of QST. Thanks for asking.

1557. Questions about amateur radio in Canada

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-01 00:46:14 UTC
From: wales@cs.ucla.edu
Message-ID: <1992Aug1.004614.614@cs.ucla.edu>
Source record: 286525

I will be moving to Canada (Toronto area) early next year, and I would like to find out what the current setup is in Canada with regard to ham radio.

I currently hold a US ham license (Advanced class) and operate on 2m.

(1) What different classes of amateur license exist today in Canada? What are the requirements/privileges associated with these licenses?

(2) How does one go about getting a Canadian ham license? What kinds of exams, fees, etc. are required? How often, and where, are the exams offered?

(3) Is it possible for a US ham to be exempted from some or all of the exams by virtue of having a US license whose requirements are equiv-alent to some class of Canadian license?

(4) How often does a Canadian ham license have to be renewed, and how much does it cost to renew?

(5) Are there any notable differences between Canadian and US amateur regulations (for example, in ID'ing and logging requirements)?

(6) Any other questions I should be asking but haven't thought of? :-}

Sounds like the major impetus for the change is so we can get the
words "Amateur Radio" into the name.

How about "Amateur Radio Relay League" ?

That way, the initials and the famous diamond symbol would not have to
change. Also the word "American" is a misnomer anyway, as our friends
in Canada, Mexico and points south will attest :=)

1559. Keeping a US ham license while living abroad

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-01 00:53:12 UTC
From: wales@cs.ucla.edu
Message-ID: <1992Aug1.005312.915@cs.ucla.edu>
Source record: 286428

I will be moving to Canada (Toronto area) early next year. I currently hold a US amateur radio license (Advanced class).

I expect to apply for a Canadian ham license after my move, but I want to keep my US license as well.

Are there any problems with my retaining a US ham license, even if I am living outside the US?

The last time I looked at the application/renewal form (Form 610?), my recollection is that it required the applicant to live in the US -- or at least to have a US mailing address. Is it good enough to supply an address in the US of, say, a family member who can be counted on to let me know right away if the FCC sends something?

Any tips on how to handle this issue would be gratefully appreciated.

That's the theory. If the TV feeder is vertical (not always true)
and if the interference is caused by common-mode currents on the feedline
(often true), then a horizontal antenna should help. Also, verticals
are often mounted on the ground or on a rooftop, so they tend to be
closer to the TV antenna/feedline than horizontal beams and dipoles.

> Will this affect 1986 and 1991 Camrys as well, or just the 1992??
> (I own the 1986 one and my parents one the second)

I have a TM 631 in my 90 camry and it works great. I have it under the passenger seat and use the RC-10 handset controller. Another option is one of the rigs with the detachable front. Put the rig under the seat and mount the front panel over the butt tray. (You shouldn't be smoking anyway....)
I have the antennas (Larsen NMOs) mounted in the trunk grooves. I use two antennas. If yoiu have 2/70, you could use a dual band antenna.

Good luck...

Jeff

Seem to recall those old Swan rigs I see at flea-fests ... You know the ones
... the 350's, 500's, 700's...the ones that drift up and down the band
(for a while until they get good and warmed up ...) but have enough kick
so no one really cares? ... (Well...maybe not _No one_...)
They are marked "Normal" and "Opposite". First time I saw that, it really
floored me. I dunno...you figure.

1564. Working Mode K

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-01 14:07:06 UTC
From: jeffj@seeker.mystic.com
Message-ID: <1992Aug1.140706.20791@seeker.mystic.com>
Source record: 286470

I read the other day about working mode K with a 15 meter vertical and a 10 meter dipole. Sounds like a lot of fun. Has anyone done this? How easy is it to work mode K? How many satellites carry this mode? Seems like a cheap and easy way to work satellites. Thanks for any help here!

Jeff

]
]I was able to over power 162.55 by transmitting on 141.15 mhz.
]Is this inherenet in any other scanners? Should this annoy
]me?

This is common in wide coverage scanners with downconversion. You are hearing an "image". In this case, your scanner has an Intermediate Frequency (IF) of 10.7 MHz. The local oscillator is at 157.94 MHz. A signal at 168.64 mixes with that and gives 10.7.

This same phenomenon allows you to hear cellular phone on a PRO-37. You can hear signals 21.4 MHz from what the scanner is supposed to hear.

It should annoy you.

The only way around it with consumer, wideband scanners is to use an up-conversion type scanner (PRO-200[4-6], PRO-42).

Yes, The IF (on my rig at least) has probably been changed. It went through
the free modification that is supposed to reduce the problem with intermod.

I like the Welz duplexer. I put mine on a HP network analyser and it
really looked good. It works fine too! It's heavy duty and can handle
amplifiers. I'm also using a Yaesu duplexer with my 736R for local FM
work and it works fine. The Larsen didn't look so good on the network
analyser, but seemed to perform ok in the mobile. I haven't tried the
Diamond, but the Comet "cabity duprexer" is excellent. (Honest, that's
the way they spell it.) My experience with all of Comet's products
has been uniformly excellent. I haven't had such good results with
Diamond products.

1570. State Scanner Law Regulations List

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-02 11:39:42 UTC
From: jdwhite@iastate.edu
Message-ID: <1992Aug2.113942.28416@news.iastate.edu>
Source record: 286457
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc

Lately, I've seen a lot of questions regarding the legality of scanners in cars in certain states, so I decided I'd post the following guide to the net. 99% of the information below is taken from the

_1992_Popular_Communications_Summer_Communications_Guide_.

I commend _Pop._Comm._ for their efforts in organizing this data into a convenient and easy-to-read form. I've been looking for a handy source for this type of information for a long time, and I *know* I'm not alone!
The other 1% (The part about amateurs being exempted from Minnesota state law regarding scanners) was added by myself. If anyone knows whether any of the following states have some sort of exemption for amateurs, please let me know via e-mail (jdwhite@iastate.edu) as I'd like to keep this chart up to date:

Florida, Indiana, Kentucky, Michigan, and New York.

Thanks!

Just to add something to California, tow truck drivers are also not allowed to have scanners in their vehicles. Apparently they were listening to them and rushing to the scenes of accidents..in the process they would run over people and get into accidents themselves.

I have heard that the easy way around this is just to have the dispatcher listen to the scanner and dispatch the trucks to the accident, but now I guess they have laws that only a tow truck called by the cops can come for the job.

Just a footnote...

>the district they're actually in.

I agree that requiring someone to compete with people in another
geographic area instead of the one that he or she is actually in
is unfair and isn't going to work. However the problem that they
are trying to address is the widespead faking of portable designators
in pileups. I've heard people signing with 3 different designators
in the span of a a few minutes just to get a contact. I don't
care that they get a QSO they didn't deserve (they know what their
honor is worth), but their actions deprive people who are trying to
play by the rules of legitimate contacts.

1577. DXCC Field Checking - Question

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-02 18:33:35 UTC
From: CSMSCST@MVS.OAC.UCLA.EDU
Message-ID: <19920802113236CSMSCST@MVS.OAC.UCLA.EDU>
Source record: 286464

I have two questions about the new field checking option for DXCC:

1. The instructions state that it is available only for first-time awards. If I'm applying for multiple new awards (eg, Mixed, CW, and 10M) on one application, can I have the cards for all three awards field checked? Since they're mostly the same cards, it would seem silly to have them field checked for one award, then send the same set of cards to Newington for the other awards.

2. The instructions state they'd like to get a diskette with the information in machine readable form. Can anyone send the the desired format.

Thankx.

1578. FT-470 Intermods?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-02 20:12:04 UTC
From: summers@hpspkla.spk.hp.com
Message-ID: <30690009@hpspkla.spk.hp.com>
Source record: 286467

I just purchased a new FT-470 and have been disappointed with the VHF receiver intermod performance. I am wondering if this is a case of a defective unit, or if it is a design problem. I measured the IMD dynamic range at 20 KHz offset and found only 44dB, while the spec says 65dB without mentioning an offset. When I connect this rig to a quarter wave ground plane mounted in my garage attic I find many intermods that do not exist on my old 2m HT (IC-u2AT). The scan function is practically useless since there are so many intermod products, and sitting on a local repeater frequency results in the squelch breaking quite frequently due to intermods from other repeaters and from signals in the public service band above 2M. With the supplied rubber duck, I notice few intermods.

I live in Spokane, Wa. which has quite a few 2M repeaters and lots of public service frequencies in use, but even so I expected better performance based on my past ICOM handheld's performance. I have heard that there was a free fix for an intermod problem at one time from Yaesu, and that the IF frequencies were changed from 17.3 to 21.7 MHz on VHF and 45.1 to 47.75 MHz on UHF. My radio has the new IFs although the supplied schematic and block diagram still show the old frequencies. So all you FT-470 owners out there, is my experience an isolated one (defective unit) or is this a problem with the 470's design.

By the way, my serial number is 2C510373

I wandered over to Amateur Electronics Supply yesterday and asked what I should study for taking the tech test in the fall. They said Tune in the World. I mentioned I had been reading the 1987 edition and what would I need to know that has changed since then. They said not to worry about it.

Well, I know that there are broader frequency ranges that went into effect since then (like can't novices do voice on 2m now?) Are there any other tidbits I should know about?

From the ARRL manual I have here, the frequency and power limits are as follows. Any additions or mods would be appreciated. Please send me email if you can.

Novice
frequency band power
3700-3750k 80m 200w
5167.5k ssb voice alaska only r3e or j3e
7100-7150k 40m 200w
21100-21200k 15m 200w
28100-28500 10m 200w
222.1-223.91m 1.25m 25w
1270-1295m 23cm 5w

non novice 30m 200w

Here's a good deal for nostalgia and Morris fans. A genuine WW II (The big one) RAF Signalling lamp. Just the job for Morris practice after "lights out" or for flashing saucy messages at the sleezy blonde next door.

Here is the blurb from the surplus dealer:

BRITISH WW2 R.A.F. SIGNALLING LAMPS

During the Air Raids over Nazi Germany strict radio silence was mandatory so signals were passed between bombers by these powerful hand held lamps. Complete with eyepiece, sights and spade grips with trigger for accurate signalling, each lamp is marked with a Crown and "A.M." (Air Ministry) together with numbers, codes, etc. Complete with original marked wood carrying case and leather handle. Terrific preserved condition; regret no bulbs available. Very unusual and interesting, a must for the WW2 Aviation Collector $34.95

The address is:
International Military Antiques, Inc.
P.O. Box 355
Bernardsville
New Jersey 07924

Phone: (908) 953-9333

Note: The no bulbs available statement could mean, no bulbs made that fit. I had that problem with British WW II surp stuff (Morris lamps etc) that used weird bulb fittings. A competant home brewer could probably make an adapter.

These "Aldis lamps" were also used to signal the tower. They have also been used to present Shakespeares Julius Caeser on BBC TV. Quite a versatile tool - as they say, Morris gets through when other modes (latin?) fail.

Does anyone know of any public domain databases that will give the latitude and longitude of US cities? I'd like to be able to translate a call sign into a grid square using that information and the call sign database.

KITSAT STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 214.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 1, 1992 BID:$ANS-214.01
TO ALL RADIO AMATEURS BT

G0/K8KA Provides The Latest KITSAT-A Status Report

At 11:30 French Guiana time Monday 27 July, the microsatellites KITSAT-A and S80T were bolted to the Ariane Structure for Auxiliary Payloads (ASAP), the ASAP was then sealed in a transport container, and the KITSAT/Surrey team started to relax. (Of course, because the campaign went so smoothly, we had already relaxed for two days on the beach over the weekend). This week the ASAP will be placed into the vehicle equipment bay, and the main customer (TOPEX/POSEIDON) will be mated to the assembly. One person will stay behind to remove the solar panel protective covers just before the composite of main passenger and microsatellites are encapsulated in the rocket fairing.

Our last act before going onto the ASAP was to make a "final-final" check of the RF links to confirm that all was ready. The campaign went very smoothly, and no anomalies were noted during the final preparation and checkout of KITSAT-A. Lest any of the more superstitious readers fear that the campaign went "too smoothly," there were some heart stopping moments involving the KITSAT tie bolts, the S80T antennas and, at the last minute while bolting KITSAT to the ASAP. (Indeed, the S80T VHF antennas didn't arrive in Kourou until today, but the Arianespace mechanical shop made some from some spare material we had brought along.)

The team is now packing the ground support equipment for shipping. At our final meeting tomorrow morning, we face the qualification specialists from JPL responsible for the safety of TOPEX/POSEIDON. If we can convince them that our tests were thorough and positive, then our work here will be done.

The MATRA Espace team -- who are the prime contractor for the S80T satellite (a non-amateur microsatellite built at Surrey) -- have promised the KITSAT team a dinner at a local "endangered" species restaurant, and we're and planning a long hard day at the beach for tomorrow. The only cloud on the horizon is that the series of scheduled Air France strikes here in French Guiana may resume before we get our outbound flight.

The launch of V-52 carrying KITSAT-A is scheduled to take place on 10 August at 23:45 UTC. Further detailed information, including the KITSAT-A frequencies and preliminary Keplerian elements, will be made available as soon as possible.

73,
Jeff Ward (G0/K8KA).

AO-16'S OBC CRASHES THIS WEEK

HR AMSAT NEWS SERVICE BULLETIN 214.03 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 1, 1992 BID:$ANS-214.03
TO ALL RADIO AMATEURS BT

AO-16's On-Board Computer (OBC) Crashes This Week

Around 01:30 UTC 27-July-1992 -- after 317 days and 21 hours of continuous and reliable operation of the file server system -- AO-16's on board computer (OBC) operating system detected an error in the RAM based spacecraft software and the OBC automatically commanded the spacecraft to "safe" itself by shutting off all non-essential subsystems and switching OBC operation to the ROM firmware. Ground controllers detected the problem at 02:00 UTC and commanded the spacecraft's straight PSK transmitter back on at 03:45 UTC. The reason for the OBC reset was quickly identified and by 01:55 UTC 29-July-1992 the command team had reloaded and re-started the spacecraft's operating system and housekeeping software.

Reloading of the file server system (BBS) software has been put on hold since a release of the an upgraded version of this software is anticipated to occur within the next 10 to 14 days. The AO-16 Command Team wishes to apologize to our users for this service outage. However, we believe the inconvenience of this outage will be more than offset by the enhanced features of the upgraded file server system software. This upgraded will bring AO-16's file server capabilities to the same level as those currently enjoyed by UO-22 users with the most noticeable enhancements being those of directory broadcasts and the ability to use the latest, semi-automated version of the PG ground station software. Complete details will appear in a future ANS bulletin.

During the file server system outage, AO-16 command stations will be performing engineering tests on several of the spacecraft's subsystems. Switching between the straight PSK and raised cosine PSK transmitters, occasional operation of the S-Band transmitter, and frequent adjustments to the transmitter power levels may be observed. Users interested in observing these tests should monitor the ASCII text block in the telemetry frames for additional information.

[The AMSAT News Service (ANS) would like to thank WB9ANQ for submitting this bulletin item.]

AO-13 STATUS REPORT FROM G3RUH

HR AMSAT NEWS SERVICE BULLETIN 214.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 1, 1992 BID:$ANS-214.04
TO ALL RADIO AMATEURS BT

G3RUH Explains Ground Commanding Problems With AO-13 This Week

Magnetorquing to a new attitude of 150/0 is almost completed, with two more perigees (out of 18) to go. This operation is taking longer to implement than planned due to the present impossibility of Mode B commanding while North America is in view of the satellite. The command uplink is constantly corrupted, probably due to an "over-the-horizon" radar system operating in the 435 MHz region.

Today for example, G3RUH spent 90 minutes continuously uplinking the same command, abandoning the attempt after 100 tries. Thus at present, magnetorque and day-to-day management commands are being generated by G3RUH, but uplinked by VK5AGR at perigee. As the southern hemisphere has only a very limited visibility of AO-13, delays of 24 hours can be introduced.

Users are reminded that the solar panel illumination is presently at an all-time low of 69%. This is insufficient to support a full time transponder, the limit being 73%. Thus Mode B "ON" was temporarily reduced to MA 35-95. Users will also have noticed automatic low-battery-voltage partial shutdown (6 dB reduction of rf power output, beacon OFF) at MA 85-90 on several occasions, and sometimes complete shutdown (transponder OFF) before MA 95.

The direct cause of this automatic premature shutdown is a few stations running in excess of 20 KW eirp, easily 10-20 dB over the beacon level, and persisting even when the low power mode comes in. Please don't do this.

If the transponder suddenly goes weak, "pack it up." Meanwhile the ON period is now MA 40-95 until the illumination improves to 73% in a few day's time. The command stations gave careful thought as to whether the transponder could even be ON at all during this re-orientation, and decided it would be safe with a little transponder time, certainly better than no transponder. In a few days things will be back to normal. Be patient!

AO-13 OPS NET/SSTV NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 214.05 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 1, 1992 BID: $ANS-214.05
TO ALL RADIO AMATEURS BT

AO-13 Operations Net Schedule & SSTV Information

AMSAT Operations Nets are planned for the following times. Mode B Nets
are conducted on AO-13 on a downlink frequency of 145.950 MHz and Mode J/L
on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

8-Aug-92 1900 B 65 W7NQM W5IU
15-Aug-92 1300 B 105 WB6LLO W9ODI
22-Aug-92 1435 J 55 WA5ZIB WJ9F

Guest commentators are planned. Join the Net if you have questions.
In the unlikely event that either the Net Control Station (NCS) or the
alternate do not call on frequency, any participant is invited to act
as the NCS.

****

Slow Scan Television on AO-13

SSTV planning sessions will follow the AMSAT Operations Nets. Fall scheduling
will require input from all interested operators. Try all AMSAT Nets for
impromptu schedules.

> I have literature from Austin, Larsen, Diamond, and Comet.

I've used Diamond triplexers and they work fine, as do the Comets. In
fact, the label on the outside seems to be the only discernible
difference between the two. They are not waterproof, so if that's
an issue, you'll have to do it yourself. Also, be aware that there are
numerous models, some with N connectors, some with UHF, some with a
combination of both. Some have pigtails, and some have chassis-type
connectors. I don't think you can go wrong with either.

Source record: 286351

wales@cs.ucla.edu (Rich Wales, WA6SGA) writes:

> (1) What different classes of amateur licence exist today in Canada?
> What are the requirements/privileges associated with these licences?

The following information is extracted for RIC-24, _Information on the Amateur Operator's Certificate Examinations_ published by Communications Canada. The information is current, however the exam's will be changing within the next few months, and this may effect some of the information I'm about to give you.

CERTIFICATES AND PRIVILEGES

There is only one certificate available for the amateur service: the amateur operators certificate. The holder of this certificate may obtain as many as four levels of qualification. The Basic Qualification is required before an individual may operate an amateur radio station in Canada or hold a licence for such a station. The following paragraphs describe how to obtain each of the four levels of qualification and the privileges accorded to those who have reached these levels.

PLEASE NOTE that no operating privileges are accorded the holder of the Morse Code Qualifications (5 w.p.m. and 12 w.p.m.) or the holder of the Advanced Qualification unless the holder also possesses the Basic Qualification.

Basic Qualification

The Basic Qualification provides the foundation for operation in the amateur radio service. To obtain the amateur operator's certificate with Basic Qualification, a candidate must sucessfully complete a theory/regulations/operating procedures examination.

The holder of the amateur radio operator's certificate with Basic Qualification may:

1. operate on all frequencies above 30 MHz, using all classes of emissions,

2. use a maximum of 250 watts DC transmitter input power, and

3. build and operate all station equipment, except for "home-made" transmitters.

Advanced Qualification

The Advanced Qualification is for those individuals who have an in-depth knowledge of electronics, a good knowledge of the various

types of amateur equipment and an understanding of the functioning of circuits that will enable them to make repairs.

Individuals who hold this qualification, as well as the Basic Qualification, may:

1. build and operate transmitting equipment,

2. use maximum transmitter power of 1000 watts DC input,

3. sponsor repeaters and club stations, and

4. remotely control fixed stations, including the use of radio links.

Morse Code (5 w.p.m.) Qualification

The examination for this qualification is a test of sending and receiving Morse code at a speed of not less than 5 w.p.m. for three consecutive minutes.

Individuals who hold this qualification, as well as the Basic Qualification, may operate in any amateur frequency bands below 4 MHz, using the classes of emmissions per Schedule II of the General Radio Regulations, Part II (GR2).

Morse Code (12 w.p.m.) Qualification

The examination for this qualification is a test of sending and receiving Morse code at a speed of not less than 12 w.p.m. for three consecutive minutes.

Individuals who hold this qualification, as well as the Basic Qualification, may operate in any amateur frequency bands below 30 MHz, using the classes of emmissions per Schedule II of the General Radio Regulations, Part II (GR2).

> (2) How does one go about getting a Canadian ham licence? What kinds of
> exams, fees, etc. are required? How often, and where, are the exams
> offered?

Most exams these days are administered by "delegated examiners." These are hams who hold an Advanced Qualification, plus the appropriate Morse Qualification if they are giving Morse exams, and who are generally affilited with a ham club. Here in Edmonton the local club gives exams every Saturday at one of the local breakfast get-togethers. You can also take the exams at a Communications Canada office. These take place every three months or so.

If you take the test at a Communications Canada office you will be required to pay a fee of $5 for each element you write. Delegated examiners may charge a fee to recover costs (such as photocopying extra exam booklets). In many cases they don't. (I've never charged for giving one.)

> (3) Is it possible for a US ham to be exempted from some or all of the
> exams by virtue of having a US licence whose requirements are equiv-

> alent to some class of Canadian licence?

No.

> (4) How often does a Canadian ham licence have to be renewed, and how
> much does it cost to renew?

Unlike the US, we seperate the operators certificate and station licence.
Your operators certificate is good for life. The certificate allows you
to operate any licenced amateur station.

In order to put a station on the air, you require a station licence.
These are issued annually on April 1 and are valid until March 31 of
the following year. The current fee is (I think - can't find the
receipt) $33. The amount is prorated based on the month of your
application. A callsign identifies a station licence, not an operator.

> (5) Are there any notable differences between Canadian and US amateur
> regulations (for example, in ID'ing and logging requirements)?

Yes. We ID every 30 minutes, not 10. You must log all contacts, including
mobile. Most of us just can't seem to find a pen when we're in the car,
though. There are no sub-bands. The only restriction on emmissions is
based on bandwidth. You can send any modulation scheme you desire as
long as it doesn't exceed the allowable bandwidth for the band you are
operating in.

Once you're here, visit a Communications Canada office and ask for a
copy of RIC-25. That document sets out all the regulations pertaining
to amateur radio in Canada. They can also explain what priv's you have
while operating under your US licence in Canada.

> (6) Any other questions I should be asking but haven't thought of? :-}

Yes.

1) Why are there so many free repeater pairs up here?
2) Why can't I seem to find any closed repeaters?
3) Why don't people swear at each other on the air?

:-)

When I looked at one of these at a hamfest, the directory seemed to
be of poor quality. For example, it would list only 3 Kansas City
repeater freq's while KC has 20+ repeaters. Also, the repeaters listed
were not even wide coverage!

In truth, I believe it would be extremely difficult to make a good
"road atlas repeater directory." Now if you could get the
ARRL repeater database (which has extensive, detailed repeater info),
then you could make a great directory!

I definitely at least skim through the technical and construction articles (*even* if it is yet another keyer or yet another VSWR meter or yet another J-pole article :-). I always skip contest results and the SK list (until the FCC recycles callsigns :-). I usually read "Happenings" (how else is one gonna find out if the 14.313 crowd is behind bars yet? :-). The ones that I wished didn't waste QST pages are the warm and fuzzy micro-novels (didn't you write one of those recently, Jim? :-). The worst are the "How knowing Morse code helped me save my dog's life" type articles.

Finally, aren't you all sick and tired of that teacher's face appearing in photo after photo, magazine after magazine (not just QST)? It was bad enough with K1ZZ's face gratutitously appearing multiple times in a single issue of QST! But, the recent photos of the rest of the HQ staff were great. We can now put faces behind the names of some of the HQ folks who are posting here!

I am glad to see that after all the rhetoric, that we are finally
getting down to some concrete proposals.

There seem to be some real fears of automatic operation "taking
over." I don't think unrestricted automatic operation will
be permitted.

My personal thinking is that we should keep the ARRL proposal as is
and simply tack on an sub-band for automatic operation.

The Lower Columbia Amateur Radio Association of Longview, Wa. announces
the 1st Annual Ham Radio, Computer and Electronic Equipment Swap Meet.

Saturday, August 8, 1992 from 9AM to 5PM at the Cowlitz County
Fairgrounds in Longview, Washington.

Talk-in Frequency is 147.26 (+rpt)
Admission $2 at the door.
Table rentals $10, Tailgate space $5, commercial space $40.
Overnight RV's $10.

Sellers may set up Friday, Aug 7 from 5PM to 9PM and Saturday, Aug 8
from 6AM to 9AM.

Mail checks for tables and spaces to: LCARA Swap Tables, P.O. Box 906
Longview, Wa. 98632.

For further information, call: (206) 425-6076 or 425-9184 or 425-1866.
(Longview is a short drive North of Portland).

Date: 1992-08-03 02:51:43 UTC
From: sharon@unixland.natick.ma.us
Message-ID: <1992Aug3.025143.15986@unixland.natick.ma.us>
Source record: 286477

I expect to be operating portable UC later this summer for a few days, and I'd like to talk to some Europeans on 40m. If I want to work 40m phone and must operate only in the intersection of the privileges of my own license and my host country ... well, I won't be operating 40m phone. However, I know that the restriction against phone operation in 7075-7100 is to prevent interference with broadcast stations, because such operation *is* permitted in parts of the Caribbean, in Hawaii, and "in areas near ITU Region 3, including Alaska." Can I assume I may also operate phone 7075 - 7100 from Belarus?

Thanks,

Sharon KC1YR

1594. Wanted - info on Icom BC-35 rapid charger

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 03:09:47 UTC
From: parnass@cbnewse.cb.att.com
Message-ID: <1992Aug3.030947.12783@cbnewse.cb.att.com>
Source record: 286378

I just bought a used Icom BC-35 rapid charger, without documentation.

Someone recently posted an article discussing operation of the
BC-35 charger and a nice table of microswitch settings for several
different Icom battery packs.

Questions:
1) Could someone please send me an electronic copy of that article?
(My news machine removed the article.)

2) I assume the BC-35 contains a simple timer instead of being
controlled by a thermistor in the battery pack (ala Motorola
HT220) ....right?

3) I have a W&W BP-8S, which is 9.6V @ 1200 mAH. How long would
it take the BC-35 to charge this? I read it takes about
3.5 hours to charge the smaller capacity, lower voltage
Icom BP-8.

Thanks for any info.

To the best off my knowledge, all of these states exempt hams from their scanner laws IF that law has a total prohibition of scanners in automobiles. Kentucky was the last state with a scanner law that did not exempt hams, that chnages just recently.

OK now I am paraphrasing from the DX bulletin.. a lovely publication edited by VP2ML/WB2CHO and published 50 times/year. FYI I pay for it and Chod wouldn't know me if he tripped over me, so I only say this becuase I think the newsletter is chock full on good stuff and I think it is worth it.. especially since info regarding the call changes in ZA was reported WEEKS ago and just about the time i started to have questions about some of the 'new' ZA call I was hearing..

Albanian nationals were originally liscenced ZA1TA* [read as A-M] have now had the 'TA' beginning the suffix dropped so they are ZA1* .. eg. ZA1TAA Agim Muco is now ZA1A (except during the IARU contect when it was the OH boys) ZA1TAL is now ZA1L.. and your friend Niko ZA1D can be QSLed via ZA1TAD, as it was his former call.

Also adding to the call changes in ZA the Albanian PTT is not going to be issuing the ZA1Z** calls to forieners as a practice anymore.. DX ops in ZA will be ZA/homecall. EG: ZA/AA1AA

1599. Renaming ARRL?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 09:49:45 UTC
From: pjml@swmis.nerc-swindon.ac.UK
Message-ID: <4226.9208031048@swmis.nsw.ac.uk>
Source record: 286381

I would consciously AVOID any explicit references to 'amateur radio' or 'ham radio' in the title. it only reduces the credibility of the organisation amongst Those In Authority. I mean, would Congress pay much attention to a document coming from the 'American Association of Amateur Doctors'? Probably not.
Is there anything in the ARRL constitution that restricts itself to purely ham-radio-related matters? Unless there is, why lumber yourselves with a title that reflects negatively in most peoples eyes?

'Ham Radio Operators? They^re the geeks who screw up my TV reception!'

Give yourself a professional-sounding name, behave professionally, and you may get some respect from those who try & poach your bands...!

> programs for ham radio?
>
> Also, does anyone know of any good FTP sites for amateur software?
>
> Randy Padawer RPADAWER@UTKVX.UTK.EDU

Randy.... there were a couple of ham radio logging programs for the Mac over the years. I have not seen a "new" release of anything in quite some time. Here is what I am aware of as well as some of the ftp sites. (This list comes from a list compiled by Patty Winter, winter@apple.com)

==========
"Amateur Radio Software for Macintosh"
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs. ZCo Corporation, P.O. Box 3720, Nashua, NH 03061.

Logging
Ham Radio Station Logbook
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

FDLog!
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

LOGic
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.
==========

A long time ago there was a HyperCard stack that allowed for control of a Kenwood TS-440 and othrs that used the same "language". I don't think it has

been changed in over 4 years.... seems like it was called KQI or something like that.

There was another HyperCard stack done for the TS-950D.

Anyone else?

73 for now....

well, according to the last amsat bulitin I got it says that the
Mir should be active with a Frenchman using F5MIR along with to of the
previous cosmo's U3MIR and U6MIR. and there still on 145.550 simplex.
Good luck. Mike

1603. Re: Ham Radio in Europe

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 12:01:41 UTC
From: jmorris@spider.co.uk
Message-ID: <1992Aug3.120141.9489@spider.co.uk>
Source record: 286385

This is in response to requests for info about 2m in Europe, for anyone comtemplating a trip here...

In outline, the 2m bandplan in Europe is:

144.000 - 144.150 CW only. Calling frequency is 144.050.
144.150 - 144.500 CW & SSB only. Calling frequency is 144.300.
144.500 - 144.845 All modes (you'll find packet on .625, .650, .675)
144.845 - 144.990 Beacons. PLEASE DO NOT TRANSMIT HERE!
145.000 - 145.800 FM
145.800 - 146.000 Satellites

There are also recommendations for EME, MS, RTTY, etc etc...

FM mostly uses 25kHz spacing. There are 8 repeater channels, called "R0" through "R7":

Input Output
R0 145.000 145.600
R1 145.025 145.625
.. .. .. etc
R7 145.175 145.775

Repeater channel use is (theoretically) co-ordinated throughout western Europe, and you should be able to access at least one from almost anywhere, except some of the remoter reaches. In principle repeaters are primarily for mobiles. Usually they are accessed by 1,750Hz tone burst, though details vary between countries. Most repeaters are busy most of the time - so just tune around until you hear one then transmit 600kHz lower!

The channels 145.200 through 145.525 are used for FM simplex. They are called "S8" through "S23" (multiply the number by 25, and that's the kHz above 145 MHz. So "S10" means "10 * 25 = 250kHz", or 145.250 MHz.) You will often find local rag-chew nets in the "all-modes" part of the band too.

Common practice is to CQ on 145.500 (S20), then move off once a contact is established. That way you can leave your rig squelched on S20 and hear much of what is going on.

2m packet is 1200 baud. Look on 144.650 for digipeaters and BBSs.

In general the band plans is well respected, which is just as well - 2m is very crowded in some parts of Europe.

General "house rules" to avoid upsetting us natives are:
(1) Don't use FM below 144.500;
(2) Don't transmit in the beacon sub-band (144.845-144.990)
(3) Only use 145.800 - 146.000 for working via satellites.

(4) Don't hog the repeater.

General restrictions: No phone patches, no third party traffic, no personal repeaters.

Repeater finance: I only know the UK situation. Here repeaters are run by "repeater groups", which are self-supporting. If you use a repeater regularly it is polite to join the group, to help finance the repeater. Typical subscription is $10-$20 annually.

Hope this helps - and hope you have fun!

1604. Mini Colorado 14er Radio Event

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 12:01:46 UTC
From: Butch@qualcomm.com
Message-ID: <9208031200.AA05753@athena.QUALCOMM.COM>
Source record: 286384

Many of you may have heard of the Colorado 14er Radio Event, QST 8/92 page 76, where hikers take HTs to the top of the 14,000 foot and higher peaks in Colorado and attempt long range VHF/UHF FM simplex. Last year, the event was on 8/24, 1991, and this year it will be on 8/30, 1992. The peak-to-peak record last year was a QSO of 120 miles from Longs Peak to Uncompahgre Peak.

I've been working in Boulder, CO for 1.5 months this summer and will be here for another 2 weeks before heading back to San Diego. Unfortunately, this means that I will miss the Colorado 14er Radio Event this year. I've found a couple of other ham friends that are interested in trying for a Mini Event this Friday, 8/7. If all goes well, Rob Gilmore, WA8YTJ, and I, KC6VEE, will climb Longs Peak. At the same time, Steve Roberts, N4RVE, will climb Uncompahgre Peak. (Maybe we can match last years record.) We will be running on 146.55 MHz sometime between 10 am and 12 noon, MDT (1600 to 1800, UTC). Its a REAL good idea to leave the summit by noon so you can get below timberline before the afternoon thunderstorm and lighting show starts. ;-) Getting to the top by 10 am is probably optimistic, also, and will require a dawn, or earlier, departure from the trailhead.

Due to the risks, only experienced hikers are encouraged to participate, but if anyone would like to join one of us or go up another 14er, please send e-mail to me, <Butch@Qualcomm.com>.

As I said, this is a group of friends out for some fun with little advance notice or planning. We do not want to detract in any way from the real Colorado 14er Radio Event on 8/30. Sadly, however, none of us will be in Colorado then. :-(If however, you want to join a very informal get-together (that has a very finite chance of not happening) consider taking the day off this Friday and climb a mountain with your HT.

Butch, KC6VEE

Having work for Tandyland, I can concur with this opinion however the problem is rooted in their method of hiring and paying of technicians. First, when I lived in Northern Virginia, they placed an advertisement for electronic tecxhnicians. I was called for an interview at a prearranged time, after waiting for ** several hours ** in the lobby, they advised me the service manager would not make it to the appointment as he was out settling one of numerous complaints received from customers in the field. After working as a salesperson, I found this to be a normal method of operation for the service department, the manager was constantly gone off somewhere...This incident made me not want to work for their repair department...This might explain why they do not attract top talent in their field repair offices

Next, after talking with a technician who was knew what he was doing, it became apparent as to why the service department returned so many items maked as uneconomical repairs. They pay their technicians the same way we were paid as salespeople, that is by minimum wage or commission which ever is greater. Further, there was imposed quotas in the form of "X dollars per hour" for repairs done, in short piece rate pay was the fast way to making more money for the technician. From my experience in the automotive electronics repair industry this leads to shoddy repairs with quick fixes, as their repair labor rates are flat like Tandylands...thus more has to be fixed in the hour to make bigger "Dollars per hour" commission.

Well that is my two cents worth on this subject.

|>use the three letter extended Anachronism (4LA).

4LA means "three letter extended Anachronism"? No wonder you're not selling anything. (I assume you're purposely confounding acronym and anachronism.)

How about "U.S. Amateur Radio Society"? If you're going to buy new letterhead anyway, might as well go the whole distance...

RTTY DX Notes 31 July
RTTY DX Notes for week ending 31 July, 1992 (BID RTDX0731)

Please note that next week Luciano, I5FLN, will be doing these notes
for that week only, as I have been requested to spend a few days under
observation in the hospital. It's not serious, it's just that a few
nurses had nothing to do for those days. I expect to be back home
about the end of the week, and will take over the notes again after
the 7th. So please send all your information to I5FLN at TG9VT or
direct to I5FLN during this coming week. Thanking you in
anticipation. But in the main thanking Luciano for his valiant effort
to take over at such a short notice.

Our thanks this week go to I5FLN, IK5AAX, NT3B, TG9VT, VE3XJ, VK2EG,
and W2JGR and the Twin Cities DX Packet Cluster Network. Again your
efforts are appreciated. Without your help there would be no notes.

Note of interest.

KB2VO who was thinking of going to Galapagos Island and operating as HD8VO, has had to cancel the trip for the time being due to health reasons. He may go there later.

G3NOM shoud have appeared from Cambodia (Kampuchea) with the call of XU1NOM, but so far no sign of him. But keep looking, he may appear soon.

FR5ZU is still on track for his trip to Glorieuses Island FR/G, Europa FR/E and Juan de Nova FR/J during September. He says that he will be very active on RTTY.

There are still rumors around about activity from Kermadeck Islands (ZL8) some time in November. Will keep in touch.

9X5LJ will be going on vacation shortly, so will be off the air.

3 main items here:

1) a few FCC folk seem to be, uhh, out of touch
2) data compression...I'm going to pass on that one
3) AMTOR (my favorite mode these days)

In article <SRO.92Aug1213528@media-lab.media.mit.edu> sro@media.mit.edu
(Shawn O'Donnell) writes:

>A year or so ago I heard of some hams who heard from the FCC because
>they were sending ZIP-compressed files via packet. The FCC wanted to
>know what they were doing sending "encrypted data."

strange... the FCC folk who contacted them must have been severely out
of touch! it is not at all uncommon to transfer ZIP/ZOO/ARJ/whatever
compressed files via ftp (using the KA9Q software or some variant of
KA9Q's version). not to mention transferring the same type files to
plain AX.25 packet BBS systems.

btw, while I'm on that thought (and sorry for the deviation here) --- where
would I get protocol specs for the file transfer protocols used to do
binary file transfers with your normal, everyday, packet BBS?

>If, on the other hand, you design your own error-correction/
>compression algorithm, [....]
>In any case, do you know how few bytes per second you're likely to
>get? (Hint: you won't have to take off your shoes to count them.)

well, if you can average out to around 2:1 to 2.5:1 (that's based on
modems that support V.42bis compression, and text data), that's about
2 to 2.5 times better than it was before. why complain? :-)

but, having found out that the net software already does this over AX.25
and/or TCP/IP over AX.25, why re-invent the wheel? I've been a bit out
of touch with the net software, and wasn't aware that it was already using
data compression.

>Do you know about AAMTOR? I've never used it, and I recognize people
>who do use it think it's a great improvement over its predecessors,
>but so far as I can tell, the protocol sends three bytes at a time.

I trust you ment AMTOR? or perhaps, AMTOR mode A? I'll assume this,
but if there's a new mode of AMTOR around the corner, I'd love to hear
about it!

anyways, yes, AMTOR is 3 characters at a time, and assuming a very clean
connection (and a clear frequency), it falls way behind hf packet. but,

when conditions are bad, AMTOR exceeds hf packet by a long shot. keep
in mind, the larger the block size, the more you have to re-transmit
every time there's an error....if you assume a very large number of errors,
you want a very small block size. (ever notice, with modem transfers, how
Zmodem reduces the block size as errors increase, and if the line clears
up, gradually increases them again to maintain peak throughput?)

AMTOR is also much more persistant than packet.... after a set number of
retries, packet gives up, period. AMTOR, on the other hand, will keep
trying pretty much until you tell it to stop. NOTE: I have certainly
seen cases where I saw a <LINK FAILED> message, but heard the other
station (he was the Information Sending Station, as I recall) keep on
trying until the link was re-established...it then picked up right where
it left off before the link failed 5--10 minutes before.

and, of course, I can't type AMTOR without saying how much *FUN* AMTOR
is, too.... great mode.

Does any one have a list of conversions for the "old" russian
countries versus the "new" ones. Something with their zip codes
would be most helpful.

The post office here says they need the new countries, but even
they don't have a list of what they are.

I am looking in particular for:
sverdlosk, which is now ekaterinburg.....

thanks

dave

This post seems as good a place as any to post some useful info I received from John Harmon. Harmon was the fellow who did the first letter in Feb 92 QST Correspondence that got lots of hams thinking about the whole issue of automotive EMI.

John reported to me that he had heard from quite a few owners of Camrys that were NOT having problems. He talked to each of them on the phone and discovered that all of them had the XLE 6 cylinder 1992 Camry. He traded his 4-banger in for the 6-cylinder model and is now operating full power with no problems.

Just to put things into perspective, this difference bx the 4- and 6-cyl models could be due to several different things -- the 6-cyl may be truly (relatively) RFI immune. On the other hand, the difference may be that his 6-cyl is newer and has undergone some production changes. There is a possibility that newer 4-cyl may have the same relative immunity. We just don't know.

So far we don't have an official response from Toyota to our letter asking them to state their EMI and EMC policies. I will post a summary of all responses to usenet after we hear from more manufacturers.

Several questions regarding the Aug. 11/12 meteor shower:

What is the best time of day for visual observation of the meteor shower in the Central time zone? What is the best time for radio observation of meteor burst effect? Is their a preferred azimuth and elevation for making meteor burst contacts? If so where in the sky (az-el) should I be beaming?

Thanks for the info.

>were in San Diego he would call with the [W1s] not with [W6s] or
>BOTH the W1s and W6s. The report states this particular
>recommendation is likely to be controversial. However, they
>point out the rampant abuse of the portable designation as the
>rationale for their suggestion. (Any comments?)

My experience in DXing has shown there seems to be two general practices for working by call areas:

1. Asking for stations in a call area (QRZ the first call area, etc.).

2. Asking for stations by number only (QRZ ones; QRZ stations with one in the call, etc.).

It usually seems to be implied that either one expects only to have persons with the number of the area being worked in the call. However, quite often a caller will qualify the call with WA9ABC in CA, or something similar. With most hams no longer changing calls when moving, there are lots of folks in AZ and CA, in particular, with call signs from other areas.

It is not fair or proper to ask folks to call with the district number in their calls; they should be worked by geographical area due to the differences in propagation. It is incumbent on the DX station to make it clear that station is working by geographical call areas, not just by the call area indicated in a call sign. This should also apply to DX nets when lists are taken. Some nets accept all calls, but usually inquire about the actual location of the calling ham if the number in the call differs from the area being added to the list. (Please no flames about list operations. If you approve of them, fine; if not, fine). I don't think those who abuse the call area scheme are large enough in numbers to justify penalizing the rest of the hams trying to work the DX station by insisting the number in the call sign will determine when to call.

The problem can usually be addressed by the operating habits of the DX station. Some maintain very good control of the operation, while others loose control easily. However, many times I have heard a DX station doing a credible job of running the operation only to hear lids that either have no ears or just want to mess up the operation by calling out of turn and never listening to the DX station when explaining how the operation is being

done and how often QSL information will be given out. A lot of problems, however, can be eliminated if the DX station IDs frequently. After 5 or 10 minutes of nothing more than "59 QSL? (is there any other report ever given) QRZ Xs." I really can't blame those who keep asking on the frequency "Who is it?"

One of my pet peeves is when a DX station is working by call areas and states "I will take six stations from each call area" then proceeds to work 6 ones, 6 twos, 10 fours, 4 fives, 12 sixes, etc. Perhaps I am sensitive to this as, being a nine, it is not uncommon to hear the station work 2 or 3 eights and nines. The only thing worse is to say "I will work one more X", then work 4 or 5 more stations in that call area.

Message-ID: <1992Aug3.145448.28003@cbnewse.cb.att.com>
Source record: 286397

I vote for Amateur Radio Relay League. I don't think the cost of changing
the logo, stationery and all the related items is trivial. I think the
League's monetary resources can be put to better use. I don't know how
the average ham in the U.S., Canada, South and Central America feels
about the name American appearing or not appearing in the name. Although
it seems most of us in the U.S. believe American is synonomous with being
a resident/citizen of the U.S., we tend to forget we have many fellow
"Americans" throughout the Americas.

I think the word Amateur is important and is a positive to have it in the name.
Amateur radio is recognized by many people in the world as a very positive
thing and has a lot of repsect (outside 20M -- I couldn't resist).

I've sent many, many ZIP-compressed files (primarily versions of the NOS source code) over packet radio and never had any inquiries from the FCC. Of course, this was at 56kb on 220.55 (before we lost that part of the band) so there may have been other obstacles to the easy monitoring of my transmissions.

But I never let that stop me -- if somebody ever asks, I'll tell them what I'm doing, but I don't feel I need any special advance permission from anyone to do something just because thousands of other hams aren't doing exactly the same thing. The FTP control channel messages that immediately precede a file transfer and name the file (e.g., NOSSRC.ZIP) ought to be enough to give anybody with nothing better to do than monitor my transmissions a pretty good idea of the file format.

Phil

1619. ARRL Name Change

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 15:35:07 UTC
From: jkeller@pica.army.mil
Message-ID: <9208031129.aa17257@COR5.PICA.ARMY.MIL>
Source record: 286403

First, I HAVE spoken (and written) to my ARRL Division Director to tell him I don't think the proposed name change is such a good idea. He says that the opinions are running about 60% "for", 40% "against"...so far...in the Hudson Division. (Hope I'm not misquoting him, if you care then you best contact him and check it out for yourself....).

I agree with Pete, G6WBJ....keeping the name we've had for all these years not only retains the established recognition factor, it also keeps whatever prestige may derive from NOT specifically mentioning "ham" or "amateur" radio. Who can really say exactly why or how the ARRL has risen over the years to its position of influence....a MAJOR position, I think....with the FCC and many individual local and national legislators? History (200 Meters & Down, old QST's, etc) seems to indicate the ARRL has done pretty well at protecting and even expanding our frequencies (who else was at the WARC that gave us the new bands? IARU? Guess what....IARU HQ is located at ARRL HQ in Conn, does that testify to ARRL's success? To it's influence?)

I sure don't want to stress the "amateur" aspect....not in a world where that means "non-professional" rather than (more literally) "a lover of"....

Last, I hope this question will NOT be resolved by a vote of the Division Directors of ARRL, or some other indirect vote.....this is a major, major issue.....we're talking about changing one of the most basic and original aspects of the organization, it's NAME !! This...(IMHO)....is an issue that should only be decided by A DIRECT VOTE OF THE ENTIRE MEMBERSHIP, and I think the 60/40 situation bears it out.

American Radio Relay League.....the name is a tie with a proud and very successful past.....why dig up our roots?

Thanks for the bandwidth.....73 de Jerry, K1MER

1620. DX Bulletin OPDX #72 August 2, 1992

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 072 (OPDX.072)
August 3, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, ARRL, DXNL, DF4RD, NT2X, WB3JFS, WB3LHD, K4CEF, K4MQG, N8AC, K8NA, W8UOF, KF8VW, K8YVI, WD9GGY, FB1MUX, JH1FDP and VE3CDX for the following DX information.

D2, ANGOLA. With plenty of activity from D2CW this week, another station became active, D2FGC. The operator is Standa, OK1FGC, and has been heard mostly on 15 and 20 meters. Suggested frequencies: CW - 7015, 10105, 14015, 18070, 21015, 24895, 28015 listening 3 kHz up. SSB - 7045, 14200, 18130, 21250, 24940, 28500 listening 3 to 5 kHz up. Standa will be using a TS940 and log-periodic antenna. He will be active from Luanda until August 31. QSL via OK1AJN. Also, F6DLQ/D2, is now active until September 3. He was heard on 21259 kHz around 1830z. QSL via F6ELE.

D4, REPUBLIC OF CAPE VERDE. Jim, N6TJ, (now active from ZD8Z) was heard saying he will be operating from D4-land in November in the CQ WW DX Contest.

GJ AND GU, JERSEY AND GUERNSEY. Lee, FB1MUX, states he will be active with FD1NLY and FB1NAN from Guernsey and Jersey between August 10 to 20. Each operator will use their own call /GU and /GJ. They will be active on CW/RTTY, 80-10 meters and the WARC bands. At the end of their trip, the operators will be active from Vierge, Bois and Logodec Islands (IOTA EU-074) using the callsign FF0XX/P. QSL info: Box 124, F-28113 LUCE Cedex, France or via bureau.

HB0, LIECHTENSTEIN. Don, N8AC (NODXA member), announced that DL5FCZ and he will be traveling to Verduz, capitol city of Liechtenstein, on September 15, 16 and 17. They will sign HB0/DL5FCZ and operate on 10-80 meters SSB/CW. There will be no WARC activity this trip. Stateside QSLs will go to N8AC.

J8, ST. VINCENT & DEP. Mitsumasa, JH4IFF, will be active from August 8 to 13 as J8/N2HNQ. Operation will be 40 to 10 meters SSB/CW/RTTY. He will mainly be active on RTTY and CW.

JARL DXPEDITION. Just a reminder to be looking for operators from the JARL Kyoto A.R.C. who will be active from Fiji (3D2IG, 3D2TX, 3D2IL, 3D2KT, 3D2IM) and West Kiribati (T30IG, T30TX, T30KT, T30IL, T30IM)

between August 7 and 15. For more details read OPDX.066.

KH9, WAKE ISLAND. Ken, KK4DK, has been active on RTTY signing /KH9. Check 14089 kHz around 0500z. He is supposed to be active on SSB/CW. He will be on the island until September 1. QSL to: OKDXA, P.O. Box 88, Wellston, OK 74881.

MAJOR CALLSIGN CHANGES IN FORMER SOVIET UNION. It has been reported that the IARU has sanctioned major changes in callsign allocations in the former Soviet Union. Here are some of the changes:
ARMENIA - "EK" series will be allocated. Its use of 4J4 series will be nullified.
AZERBAIJAN - "4J" series for exclusive use. (4J1FS may have to get another call someday.)
RUSSIA - exclusive allocation of UAA-UQA block.
UKRAINE - exclusive allocation of URA-UZA block and will relinquish all "RB" calls, as the letter "R" is going to Russia exclusively.
There may be additional changes pertaining to other republics, but at this time information wasn't available. (ed. Gee! Think of all those computer databases that will have to be changed.)

P40, ARUBA. Nao, NX1L, (ex JH1VRQ) will be active as P40P from September 7 to 9. Activity will be on all bands and modes. QSL via NX1L.

PERSEIDS METEOR SHOWER. Mark, KE7NS, is interested in running 2 meter meteor scatter and is looking for anyone to set a sked with him. The date for the "Perseids Meteor Storm" is August 11 with the shower's peak to occur at 2210 UTC. Mark's Grid Square is DN41, and he will be active portable on a mountain top, approximately 9000 feet. You can reach Mark at 801-399-1058 (Ogden, Utah).

S2, BANGLADESH. Another station became active this week with the possiblity of more to come. Ray, G3NOM, is now active as S21U. He has been heard on the 14226 DX net around 2100z. It has been reported that Erik, WZ6C, will be picking up his S2 callsign Dhaka very soon. S21A continues to be active on 14256 and 21335 DX Nets.

TL, CENTRAL AFRICAN REPUBLIC. Serge, TL8PS, was heard this week on 14023 kHz around 2145z. QSL to: Philippe, Box 265, F-67500 Haguenau, France. TL8IM was also active, but on the 14226 DX net around 2130z. QSL via AC3D.

UPCOMING DXAC VOTE. Ted, K8NA (Great Lakes Division representative and DXAC Chairman), has informed OPDX that the DX Advisory Committee (DXAC) has scheduled a vote to take place August 24 on several topics. One of the major topics is the DXCC country status of Croatia, Slovenia, Bosnia-Hercegovina, Macedonia and the possible change of Yugoslavia. Another vote will be on the recommendation to delete Abu Ail. The DXAC will also vote on the acceptance of their subcommittee's report on "DX Operating Practices". This report was done at the request of the ARRL's Board of Directors meeting that took place in 1990. There will be

"Advisory Votes" (which are possible topics for the DXAC to research) taken on "Docked Maritime Mobile DXCC Credit", the Master DXCC Award and the re-examination of DXCC status for 4U1VIC (Vienna International Center).

VK9M,VK9W,VK0 UPDATE. Jim Smith, VK9NS, made the following announcement this week: Jim is going to be away on business for about two weeks and about a week after he returns Jim will make a decision on whether he will be going to Mellish Reef and Willis Island. He further stated that support is shaping up for the Heard Island DXpedition.

VS6, HONG KONG. Tim, KJ4VH, will operate /VS6 on CW in early August. There is also a possibilty of a weekend trip to Macao (XX9).

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. Source record: 286407

This is something that's been on my "to-do" list for quite a while. Although it is probably something I would EVENTUALLY get around to (i.e. in a few months), I really don't want to be an obstacle to this valuable information reaching the net.

A motivated reader of this newsgroup from Greece sent the FAQ coordinators some very useful resource files (both from him and from others), including:

1. Packet Hardware and Manufacturer's Addresses
2. Packet Software Versions
3. Amateur Equipment Manufacturer's Addresses
4. Amateur Equipment Manufacturer's Phone #'s

What the net needs is another volunteer to take the files from me, edit them and correct them as necessary (not necessary to squeeze out ALL the errors, just the obvious out-of-date data), and submit them to the Supplemental Archives by E-mailing them to Andy Beers at the University of Buffalo.

In addition to getting this information out more quickly, there is another motivation for me to do this. Namely, to familiarize others on the net with how information is gathered and submitted to the various bodies of distilled wisdom such as the FAQ's and the archives. Athough us FAQ maintainers enjoy the job that we have volunteered to do, our energies have been spread a bit thin lately.

If someone would be interested in doing this task (with some guidance and help available from me, of course), please contact me via E-mail. Please note exactly what I am asking for (i.e. a volunteer to put these files in the archives). Please don't send me mail asking for the files for your own personal use. I only restate this to avoid any misunderstanding or conflict.

Anyone feeling particularly motivated today?

73, Paul W. Schleck, KD3FU

;thing I ask is send it via e-mail since the net is cluttered
;up enough now.

I am a fairly new ham (one year)..This statement really
caught my eye "Why can't we have more [articles] on the fun
of Hamming and less on the projects for the homebrewer."
Sounds like a pretty prejudiced and stupid statement to me.
Not everyone thinks the same about what is fun in ham
radio.. thats what makes ham radio so great. I read most of
the technical and project article. I don't have an
electronics background and won't build a 100th of what they
publish, but I sure do enjoy reading about it. To me the
most fun of ham radio is to build something and have it
work..no matter how big or small.. built a memory keyer and
the optical straight key and loved it. Just built a PVC
Vertical antenna from CQ magazine for my portable QRP and it
works great and had a great weekend building and testing it
(did a DX expedition to the center of my driveway).

>
>Point being that the manufacturers *do* have to sell type-accepted radios
>and the European spec radios might not be available. Perhaps mail order
>from Europe? Or buy when you get there?

This is technically incorrect, though the intent is right. Type Acceptance
is a particular certification required for transmitters in certain services.
Only external HF linear amplifiers have to go through Type Acceptance in
the amateur service. All other radios have to go through a different
certification process that is much simpler. This is to comply with spurious
and unintentional radiation limits. A sample of the equipment must be
certified by an independent testing lab. By contrast, Type Acceptance
requires approval by the FCC lab and includes an analysis of the circuit
design, shielding technique, quality of construction, as well as physical
testing. In some cases, random samples from the production line must also
be submitted. In addition to testing for unintentional radiation, performance
testing is also done to see that the radio meets it's published, and legally
required, performance limits. This process is usually a long one. This is one
reason Type Accepted radios sometimes cost so much more than amateur radios
even though they may be physically the same.

An example of the kind of performance testing required is with broadcast
transmitters. They must meet all specifications for distortion and spurious
operation over a power range of 80% to 110% of rated power to achieve
Type Acceptance. Many ham rigs won't even make rated power.

|> levels in Class B are far in excess of the levels that can upset
|> communications receivers. The amount of shielding employed and the
|> care with which it is installed is much more important than an FCC
|> label.

'Class B' is a significant improvement over 'FCC Class A' (About 9 to 10 dB). So given a choice I would always purchase a 'FCC Class B' device. From my experiance as a Project Manager / Engineer on monitors and personal computers several years ago, Class B is alot tougher and at home where I run only Class 'B' monitors and computers I have almost no RF getting into the radios (from 1.8 MHz to 1.2 GHz). Any RF that comes from the monitors or computers has been reduced with just a few ferrites on some of t

he cables (video is the most common).

So again a 9-10 dB noise reduction is a very good thing... I recommend 'FCC class B' for all HAMs.

Well the moaning that accompanied the murder of Ham Radio by CQ
indicates that there is strong interest in magazine articles
with strong technical content. The excellent, but infreqquent
Communications Quarterly attests to that as well. My understanding
is that Ham Radio folded not because of lack of readers, but because
the publisher desired to sell out. On the other hand, the popularity
of CQ attests to the fact that there is a large readership for non-
technical material. QST is more difficult to judge by market forces
since it is a side benefit of ARRL membership and not a direct purchase
item.

My cut at the content of QST is that it is a small part dry technical,
a large part DX and contest news, part mice type traffic reports,
a lot of administrivia, and a huge part catalog. I'd like to see more
articles describing construction projects that go more in depth as to
why a circuit design was used as well as *how* it was done. There
is some beginner level material like this, but little *advanced*
material of this kind. Chocolate milk and cookies are fine, but
sometimes we'd like to see some steak.

Totally non-technical articles like "How we fought the mosquitoes on
Field Day" are ok once in a while, but I wouldn't want to see many of
them unless they are *really* well done. More interesting to me are
stories that lead to technical solutions. Steve Cicara's old columns
in Byte are an example. Great stories and cute technical solutions.
There used to be a column in one of the general electronics mags like
this as well. I remember building a proton precession magnetometer
because of one of those stories. Worked too! And I learned a lot
trying to figure out how to make it work. Encourage your authors
to say *why* they did things as well as how. Not just the technical
whys either, let them talk about the *motivational* whys as well.

For Sale: Excellent condition Kenwood 940S/AT HF RIG.

Features:

SSB, AM, FM, CW, RTTY
250 W SSB, CW; 140W AM
Built in 20-150 impedance antenna tuner
Built in power supply
40 memories, two VFOs
Various filters, etc (Notch, AF, SSB Slope, etc)

This unit has been used very infrequently. I'd estimate less than
40 hours total use. I cannot even transmit with it. Includes:

Owners manual
Power Cable
Nice dust cover (didn't come with it orignally)

For $1600 or best offer. Price includes shipping COD UPS Insured.

I'll throw in 50' RG58X cable and some braided antenna wire, too. And
Also including the MC-60A microphone which has remote tuner.

$1600- no reasonable offer refused.

Cheers,

Doug

>handle. It takes a long time to get to them all over the air !!

Off the subject of magazine content, but I'd take issue with the above
packet interconnect scheme in certain circumstances. If the area is
subnetted properly, and if the backbone network is engineered properly,
then changing frequency and directly connecting is THE WRONG THING TO
DO. That's because of hidden terminal problems, out of area addressing
issues and the like. In other cases where the network is poorly engineered
and configured, it may be the best thing to do. In general, DX connects
are to be discouraged in packet. Locality is the key to good network
design. Other network users should *always* know where to find your
station. That generally means staying put where you belong.

>I think also that specialized publications are another very good way to go for
>general (specialized) info. The contest Journal is an excellent publication as
>is QEX.

Specialized publications are ok, but QEX has been mighty thin and what
content it has is often lightweight. A single issue of Communications
Quarterly is worth a year's subscription to QEX. That's sad but true.
The Contest Journal, however, could be offloading much of the non-technical
material from QST, but I still see a lot of duplication. That's probably
inevitable.

>I answer a lot of questions in writing a hardware/software column for the RTTY
>Digital Journal. Most readers have very basic questions and making cables,
>hooking things up is beyond a lot of them. Which is good because I can do that
>:-)

Pathetic isn't it? Especially when the callsigns indicate that they're
eligible for QCWA. We mustn't fail our duty to encourage beginners, of
whatever age, but we must avoid slanting *everything* to the beginner

level or we fail to challenge more advanced amateurs. This is the major failing I see in the ARRL magazines. It's hard to not lose the beginner *or* the advanced amateur. One will be confused and the other bored. Greater use of sidebars is one way to have nuggets for both, but that can become confusing if not written well. Good writing is the key to good articles of whatever kind. If it's interestingly written, I'll even read a DXpedition report, though I wouldn't *work* DX on a bet.

>COMMENTS PLEASE!!!!!!!

>towne@unixg.ubc.ca
Very Very Good (no crap that I can think of). I have had one since Last
November and have been carrying it around in my briefcase for a QSO on the
go. It gets banged around pretty good. No problem!

Two comments though:
1. On 12 volts (either 12 volt battery pack or car cord) The unit gets
WARM if you run it on high power for a very long time. (on the other hand, it
does perform better with the 12 vlt pack than with the 7.2 vlt pack).

2. The rubber duck antenna it comes with s*cks! I have replaced mine
with an aftermarket unit (not the larsen, the other one with the yellow hang
tag package) and I am much happier!

3. I notice a fair amound of intermod interference in the Boston
area when I am around the Radio & TV towers near Needham. (But I am told
that this is a common problem). However, I have not had any problems in
ignoring the interference, as it dosen't affect xmit.

Good luck! and 73 Rich G. KA2TMT

The Lower Columbia Amateur Radio Association of Longview, Wa.
announces their First Annual Ham Radio, Computer and Electronic
Equipment Swap Meet.

August 8, 1992 9 AM to 5 PM at the Cowlitz County Fairgrounds in
Longview Washington. Talk-in frequency is 147.26 MHz (+rpt).

Tables are $10, Tailgate spaces are $5, Commercial space is $40.

RV overnight is $10.

Set-up is Friday night, Aug 7 from 5 PM to 9 PM and Saturday,
August 8 from 6 AM to 9 AM.

For more information, call (206) 425-6076 or 425-9184 or 425-1866.
Longview, Wa is a short drive North from Portland, Oregon.

1644. R5 Antenna/Verticals

Re: Scott, WA7VYJ, query on verticals/ Cushcraft R5 and R7......

I've seen some of the tech responses, comments on angles of radiation, gain, RFI propensities, etc.....to me the real measure of worth is the actual performance (one of the reasons I like this net is all the reports of actual experience, hands-on).
I can't comment on the R7, but last October I got back on the air (after a 25-year hiatus) somewhat hesitantly on 10m with 100 watts and an R5 I picked up for $75 from a local ham/elmer. I was absolutely floored with the 10m performance!! The SWR wasn't any better than 1.4:1 anywhere in the band, and I could only get it up about 25 feet (half the antenna height is lower than the peak of my roof!!)....but in the first 6 months (Oct 91-Mar 92) I logged 175 countries (incl. China, India, Mongolia, etc) so you won't be surprised that I'm a BIG fan of the R5 !!! One thing I am pretty much convinced of is the need for a really solid ground when using a vertical. Mine is 5 eight-foot copper-clad rods spaced a foot apart and tied together with heavy copper strap.....only 3 to 4 feet from the station (just the other side of the garage wall).

I'm hoping to find time soon to get my code up to 13wpm for an upgrade, so I can get on the lower bands....if the R5 performs t5here as well as it does on 10m, I can't wait !!!

>With the supplied rubber duck, I notice few intermods.

The FT470 is optimized for sensitivity rather than selectivity. That's because it's expected usage is on a rubber dummy load rather than a base antenna. Yaesu expects you to use a base radio on a base antenna, a mobile rig on a mobile antenna, and a duck on a talky. Now some people consider that an unreasonable restriction, but comparing the performance of a dual band HT to a 2 meter only unit is not really fair. The wide coverage of the 470 means it can't have as effective front end filtering as a 2 meter only radio in a small package. All that said, the 470 *is* more intermod prone than some other radios in it's class. But, it is less power hungry than they are. This is another tradeoff Yaesu made. To get good intermod performance in a wideband front end amplifier, high standing currents are required. Really stiff front ends in some base and mobile radios draw 100 ma resting current in the RF stage. Because Yaesu was trying to extend battery life in monitoring usage, and they succeeded admirably, they don't use a stiff RF front end. That leads to more intermod, especially when used with an outside antenna.

If you want a radio with a great user interface, low battery consumption and excellent sensitivity, all in a relatively small package, the FT-470 is a great radio. If you want to do wideband scanning with an outside antenna, the FT-470 is not a good choice. Radio Shack sells scanners for that purpose.

Cross-posted to: rec.ham-radio.swap,rec.radio.swap,rec.radio.amateur.misc,rec.radio.cb

I have a D&A Manufacturing linear amplifier (model KWD 1000).

I would like to know about how easy it is to retune to 10 meters, and how clean its output is. If retuning and cleaning its output (if necessary) is impractical (or not worth the expense due to its worth), I would also like to know about how much it is worth and the best means of selling it. I am interested in an HF amplifier.

Is anyone familiar with the beast?

> HT220) ....right?

None of the Icom desk chargers are simple timer controlled chargers. The BC-35 makes use of the thermal cutout switch in Icom's rapid charge packs to tell it when to change from rapid charge to trickle charge. When the pack switches to trickle, it's ready for use. With non-rapid charge packs, the microswitches tell the charger, you have to time the charge cycle yourself. Fourteen hours is the normal time required for recharging, but trickle charge won't hurt the pack if you leave it in the charger for a longer period.

In NJ you can go to the Geostat map stores. There is one in Menlo Park and one in Rocky Hills (right by the Princeton Airport). They're a couple of bucks a piece. I would suspect that maybe one of the RU libraries might have a set you could use there.

Of course, I'm spoiled, I now live a few blocks away from the USGS in Virginia and can just swing by there and pick them up.

No, it's a design problem. It's really a problem with all the wide range dual banders, but the Yaesu seems to be particularly succeptible. While I never noticed in NJ, when I moved to VA the pager intermod became a problem. The intermod fix helped some. The 32AT gets some (though not as bad as the YAESU).

1651. NEW ALINCO PRODUCT ANNOUNCEMENT

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 19:33:39 UTC
From: jay@sw.stratus.com
Message-ID: <5330@transfer.stratus.com>
Source record: 286331

Alinco has just announced their new product, the SR-4 super repeater controller. The SR-4 is a fully self-contained, microprocessor based, remote programmable controller. The SR-4 can convert any radio, on any band, at any frequency, in any mode (AM FM SSB) into a full featured simplex repeater complete with time out timer, voice id'er and voice mail capability.

There are two versions of the SR-4. The SR-4 can control one radio for simplex operation. The SR-4D can control 2 radios for duplex repeater operation. There are only 3 simple connections for interfacing the SR-4 to any radio; speaker, mic and PTT. The SR-4 is supplied with the cable to interface with Alinco mobiles. Other cables are available for other ham manufactured gear. The SR-4 operates on 10-18VDC at 150ma, 60ma in power saver mode.

In the single radio simplex repeater config the Sr-4 will store and forward any audio message using solid state digital audio technology upto 2 min and 48 seconds with amazingly clear audio quality. The resolution is high enough to relieably pass DTMF or other audio tones for paging applications.

The SR-4 is fully DTMF controllable. The remote control features:

Power on and off
Power saver on and off
pass or mute DTMF tones
changerecord/playback sample rate
activate range test features
turn acknowledge tones on/off
Courtesy tone off/on
record or playback voice mail
erase voice mail
record voice ID
force play voice
force play ID
erase voice ID
set ID timer
turn ID timer on/off
Toggle aux output
disable transmit
disable receive
Duplex feature on/off SR-4D
Dual radio simplex feature on/off SR-4D
more features

OK folks more will come. I will entertain questions if you have any. I have tested this unit in part remotely and will be receiving one shortly for an in depth look. The product will be available September 1st.

SR-4 399.95 and the SR-4D 534.95 suggested retail

My address is Jay_Appell@cad.stratus.com.

From: ron@pilot.njin.net
Message-ID: <Aug.3.15.34.31.1992.5162@pilot.njin.net>
Source record: 286332

Tune in the World is going to make you very
disappointed as it only covers element 2 and not element 3A
which you will also need for Technician. You can supplement
it with a question pool book as most of the other info is
complete. The ARRL switched to a new book called "Now You're Talking"
which is a redo of Tune in the Worms with 3A in it as well.

The only difference in your freq list is that the 80m band is 25 kc
lower than you ahve. Everything else is the same. No, novices still
can't work 2m. Note the VHF/UHF freq's you have are only the novice
ones, you need to make sure you study the tech ones as well.

I got a new Icom W2A, I am very impressed overall, especially
with Icoms marketing department. You see it's 12V external
power jack looks like a normal power-coax connector like you see
on so many 12V external power jacks, but Icoms has a twist, it has
a very thin center conductor as so...

```
| |
| |
| |
| |
| |
| | |
| | |
| | |
| | |
| |
```

As you would expect the local Radio Shack doesn't carry it, so before
I start calling every electronics supply place in the State I seek your
collective wisdom. What is this thing called and how do I get my hands
on some of these gems?

Another related question, I heard there are good third party batteries
for this Icom, is that so?

WA6MFZ...

>What do others think about the
>balance of general-interest vs technical articles?

In the last year or two there has been a big increase in the cutesy-pie fiction stories. In my opinion, a few of these go a very long way.

Now, I'm an engineer, so I realize that I may have more technical interest than the average ham. But there are other types of non-technical stories that could be run. How about tutorials on operating DX or contests? When was the last time we had a description of grid squares and VHF/UHF weak-signal operating techniques? On a semi-technical level, how about an article covering receiver/transmitter specifications? It would describe what they are and which ones are important when choosing a radio to buy.

We've had plenty of "introduction to packet radio" type articles, so we probably don't need another that covers how to CONNECT through your TNC. But how about the next level up: An article covering NET/ROM, TCP/IP, ROSE, the future of high-speed data links, etc (in moderate technical detail) would be interesting.

Hmmm... If I remember correctly, radio waves are e-m waves and travel at the speed of light (c). This is 186,000 miles/second, which calculates out to

1/4 mile in approx. 1.344 MICROSECONDS!

I dare ANY hot rod to even TRY to beat that!

1656. Me and My PVC antenna

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 20:01:00 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GN5DDH7G009GV7U2@TNTECH.BITNET>
Source record: 286427

Me and My PVC:

Well after putting together a QRP backpacking station (a MFJ 20 meter QRP, lead-calcium batter, a resonant dipole, and a straight key) and almost getting kicked out of a motel for stringing up the dipole between 2 buildings over the pool and jacuzzi area, I decided I would like some other type of portable antenna.

Got my CQ magazine and read about a PVC Beam.. sounded great and made reference to an earlier article on a PVC Vertical. Got hold of the article on the vertical and built it this weekend. Was real cheap and easy to build.

Set up my portable station all the way in the middle of my driveway. There was the NA CW contest going on .. so plenty of opertunity to test things out. I leisurely worked over 30 contacts in about 1 1/2 hrs. Worked about 8 Europe stations a couple of Asian, East Coast, West Coast and some in the middle. Couldn't find anyone to rag chew with. After a while decided to go after some weak signals and actually with some patience got one weak signal in France and one in England and a couple US.

Still haven't figured out how I could do it.. band conditions didn't seem that good.. was putting out only 3 watts and according to my readings from the ARRL Antenna book the antenna should have only about a 25% effeciency.

The antenna is only 10 feet high with 16 feet of wire helically wound and (2) 16 foot radials (will have 4 when I get home tonite). If a 1/2 wave dipole is 33 or so feet that should mean that the antenna is 1/4 wave with (2) 1/4 wave radials... well it seems to work very well and I can't wait to build the Beam version (just have to find out how to get hold of the Torroid Core.

From: wws@craywr.cray.com
Message-ID: <1992Aug3.155128.29292@walter.cray.com>
Source record: 286337

At the first 'real' hamshack I visited as a kid, the OM had a full S-line. He had a 32S-1, 75S-1, 30L-1, the station console, and matching mike. (He'd been licensed since 1918, had every QST from about 1920, and lots of old gear. He willed it all to the Smithsonian when he became a Silent Key.) He let me call CQ on it, using his W9xx call, so I guess my first ever QSO was made on Collins gear!

The 75A recevier series went from 75A-1 through 75A-4. The matching 32V series went from 1 through 3. These date from the late '40s to the late '50s. Big black boat anchor boxes. Great for AM. Not real sensitive on receive. I think the KWM-1 was the first transceiver in the ham industry, but only worked some of the higher bands.

The S-line spanned about 20 years from the late '50s to the late '70s. It proceeded through the 75S-1, 75S-2, 75S-3[ABC], and 51S-1 receivers. The 51S-1 was general coverage, but missing many ham-oriented features. The 75S-3A and 75S-3C are identical to the 75S-3 and 75S-3B respectively, but have the second crystal deck. The 32S-1 and then the 32S-3[A] were the transmitters of the line. Again, the 32S-3A is identical to the 32S-3 with the addition of the second crystal deck.

Likewise, the KWM-2 and KWM-2A were identical except the 2A has the second crystal deck. (I heard a rumor that a bunch of KWM-2As were built special for MARS use in Desert Storm. Can anyone confirm? I also heard MARS bought a bunch of Paragons from Ten-Tec.)

The 62S-1 was a 6 and 2 meter transverter for SSB and CW.

The 32L-1 linear was rated at about 5-600 watts and is desk top sized.

The 32S-1 linear used a 4CX1000A tube. I've used one. You can run it at a *conservative* 1200 watts output. After 24 hours of Sweepstakes last year, you could place your hand on top of it and it was barely warm. This particular amp would do 1500 out, but the grid current was pretty high - so we cranked it back to 1200. (With a 5 element monobander on 20 meters, it prob'ly didn't matter much...)

You may hear about 'winged' or 'round' emblem gear. The winged ones are older. When Rockwell bought out the company, they 'clipped the wings'. Collins still exists, as part of Rockwell, but these days their time is filled making widgets for the government to shoot into space.

Concerning the KWM-380. This came out in the late-70's. It is solid state and has a digital readout. I've never used one, but friend of mine used one in Field Day once. He had so many problems with it (unspecified) that they ended up using a Heathkit SB-102 for the remainder of the contest!

I have a Drake R-4C/T-4XC and a (borrowed) 75S-3A/32S-3 at home. I've compared them quite a bit. The rigs have a very different feel to them. The Collins VFO is very smooth and the receive audio is wonderful compared to the Drake. The 6146 finals are much more sturdy than the 6JB6 sweep tubes. But in many ways, for general hamming, I like the Drake gear better. The notch filter and passband tuning in the Drake seem to work much better than the adjustible BFO and 'rejection tuning' in the Collins. The 200 khz VFO in the Collins is also a nuisance. You only get 200 khz of 10 meters, not in the novice band, by default. The 32S-3 is somewhat more finicky to tune than the T-4 - especially on 80 meters. And the transceive capability is more flexible on the Drake. Both transmitters seem to sound great on the air.

I tried calling Collins in Cedar Rapids a couple of years ago to get some information. They were not helpful at all. In fact, the man basically refused to talk with me. :-(They do not stock parts, perform service or support in any way their old gear. He could not even photocopy a manual for me. (This is very unlike the service I have gotten from Drake who still stock parts, still service the old gear, and have been extremely helpful. If Collins and Drake ever get back into the ham buisness, I *know* which rig I will choose.)

IMHO, the distinguishing features of Collins gear in it's day was the mechanical quality of construction, the patented mechanical filters, and a conservative electrical design. These features came at a price, which explains why they were so expensive new. It also explains why the rigs are still around now.

Has anyone tried the EEB kit to put Collins mechanical filters in their ICOM gear?

For faithful reproductive service may I suggest joining with a Heathkit DX-100. Fidelity will be assured by nature of the DX-100's appearance but despite its looks you will find that this 100 lb 120+ watt plate modulated AM transmitter gives the most bang for the buck.

Send me mail for some interesting DX-100 mods I have collected.
CU on 29.100-2.150 this winter.

> What features would you find useful in a handheld ?

And in the order that I find important:

1. Rugged. Motorolas can be thrown at people from the freeway and
live to talk again. BNC connectors that don't tear the PCB apart
when you put that 4' gyno-rod antenna on your HT. Battery packs
that don't disembowel your HT if you drop it.

2. Simple panel controls. Ever try and enter an odd split at night on
the freeway?

3. "Normal" batteries. AA size packs for 7.2, 9 and 12 VDC operation
that open up and are repairable.

4. Single band operation. Multiband HTs are like multiband verticals,
they work equally poorly at all tasks. Too wide a front end (for
those of you that HAVE to listen into cellular) results in serious
intermod and front end overload problems.

5. Cost is obviously something to consider, but I'd like to add, that
saving money by buying an unusable radio is no better than paying
big-bucks for something that dies the first time you drop it.

1665. new internet to packet gateway

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 21:39:54 UTC
From: bob@arasmith.com
Message-ID: <15k93aINN85d@hal.com>
Source record: 286338

I have enabled a internet to packet gateway on my bbs. I have further extended it to allow internet users to appear to live on the bbs system. Thus doing away with cryptic addressing.

In short it works this way. A packet user wishes to send a message to you. When the white pages are checked it shows you as having your home bbs as N0ARY. When the message arrives at my bbs this address is translated to an email style address and sent through the gate.

Sending messages through the other way is just about as simple. If the person you wish to reach is n6zfj@n6qmy you simply address your message to n6zfj%n6qmy@bbs.arasmith.com. Notice that the '@' in the packet address is a '%' on the internet side. You can originate bulletins in the same fashion, exams%allcan@bbs.arasmith.com.

To use this service you have to register in advance. My system has to be able to translate your "from" address found in your mail header into your callsign. This means that you will have to always use the same host to originate messages.

If you would like to take advantage of this service just send a message to:

gateway-request@arasmith.com

with the following information.

CALL:
First name:
City and St:
Zip:

This information is necessary to fill in your white pages entry on the bbs system. When your registration has been processed I will send you full instructions for using the gateway.

Depending on the demand I may have to limit registration until the system has been fully tested.

1666. Alinco 599vs590, worth the $$

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 21:43:31 UTC
From: brianm@hprnd.rose.hp.com
Message-ID: <30950021@hprnd.rose.hp.com>
Source record: 286345

Is the new Alinco 599 worth the extra $$ over the previous 590? AES
is clearing out the 590 for under $500 and the new 599 is ~$650. What
is the net's feeling on this?

Due to the limited information in the advertising and product brocures,
Other than the AM aircraft band mode, I haven't found anything the 590
has the 590 doesn't. Short of getting both radios operating manuals
it's difficult to find much detail about the radios.

The key features I'm looking for are Remote head, Remote control (remote
base from a handheld and DTMF), and packet capability.

Are there any other rigs besides the Alinco that have the Remote Control
functionality?

Thanks for any input..... 73s N6UGP

1669. rectifier tubes: 866=3B28 ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-03 22:29:12 UTC
From: wmc@phx.mcd.mot.com
Message-ID: <1992Aug3.222912.15278@phx.mcd.mot.com>
Source record: 286249

I just bought a Johnson Valiant in what seemed to be great condition, BUT...

The schematic shows 2 866A tubes in the high-voltage rectifier circuit. But there are 2 3B28 tubes in the radio! I found a tube cross-reference that does not link these two types.

I'd appreciate it if somebody out there with a tube manual that shows base diagrams would look up the 3B28 for me. (Not too many tube manuals laying around here at Motorola :-)

Thanks in advance! (This is part of my becoming another "born again AMer!)

>Does anyone make an omni-direction multi-polarized (switchable CW/CCW/V/H
>remotely) multi-band antenna for HF?

I don't know of anything commercial, but you could build one...

How about a turnstile for omnidirectional (well, almost) horizontal coverage? Changing the feedline from one dipole to the other would change the circular polarization - for signals going up, at least.

Add a quarter wave vertical element and feed it against the turnstile elements which would be connected together. This would give you a ground plane for omnidirectional vertical polarization.

It will be left to the reader to devise the feedline and antenna switching matrix to remotely perform the necessary connections! ;-)

While speaking of omnidirectional, horizontally polarized antennas, does anyone have experience with Alford arrays?

> COMMENTS PLEASE!!!!!!!

Takes a licking and keeps on ticking! Nonstandard battery box design (whole back comes off) is lose on heat dissipation but have made it into win for mobile mount. Bought drycell back and installed circuit board, blocking diode, wire to cigarette lighter plug, glued velcro on back and opposite sex to car dashboard. Now can get into car, unsnap battery box and snap into dash mounted powered back. Also swap ducky for 5/8 wave mag mount on roof.

Human engineering is very good. When gets into weird mode follow this algorithm:

1. Recognize which weird indicator on LCD screen is active.
2. Find keyboard button with same marking.
3. Push button until weird indicator goes *completely* off.

Well, it's understandable you don't know what Morris code is Ted. It's part of the uniform commercial code and should never have been refered to here! This news group gets cross posted to a lot of Packet BBS's and the mention of it here could cause a lot of BBS operators (to say nothing of other digipeater operators) trouble with the FCC. It's just this kind of irresponsible posting that gets netnews a bad reputation!

1675. Need advice from HW-101 experts

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 00:43:00 UTC
From: lockwood@acidqueen.Eng.Sun.COM
Message-ID: <l7rkkkINNce3@smli.Eng.Sun.COM>
Source record: 286355

I'm working on bringing to life a Heath HW-101 that was assembled in '75 or '76, but which has never been used. It's had some assembly problems like any kit can have the first time it's turned on, but one problem with the AVC has me going in circles. I'm hoping there are some HW-101 gurus "out there" who can get me going in a straight line again.

Here's the situation:

The rig basically works, but the S-meter (switch in ALC position) does not work. In fact, the needle is hard against the left peg once the hw-101 warms up. The meter works fine in the Relative Power and Plate Current positions, however. Possibly related, the audio level is not as strong as on my other, tried and true HW-101.

What I've learned:

* The AVC grid voltage on V3 drifts in a positive direction during the first few minutes of warmup when the RF gain control is full CCW. As it drifts the meter will move from full right peg to full left peg. Once the rig is warm, no position of the RF gain control will influence the S-meter to move off the left peg.

* When cold, the AVC bias on V3 can be varied with the RF gain control between ~+.5 and -12V. After warmup, the lowest I can get the grid voltage to go is ~-6V. However, rotating the RF gain control does affect the plate and screen voltages which indicates to me that the grid bias may be controlling the plate current, as it it should.

* The S-meter wiring seems to be correct. I've gone over the assembly instructions many times and visually compared the wiring and component values against the schematic many times in hopes of finding something I've overlooked. It looks like it is wired correctly and that there are no solder or PC trace problems.

* In looking for the component that is drifting, I've blasted every bias resistor and decoupling capacitor in the AVC circuit with freeze spray.....no effect.

* If I remove V3 and turn on the rig, the grid bias is well behaved and never drifts no matter how long I leave the radio on. Also, the range of voltage movement is similar to what it is right after a cold start, ranging from near 0V to -12V.

* The plate and screen voltages on V3 agree reasonably well with
the voltage chart in the manual and with similar voltages on
another (working) HW-101 I have.

* Swapping V3 tubes between the two HW-101 rigs has no effect.
(V3 is a 6AU6, by the way.)

My conclusions:

It looks to me like the grid of the V3 tube is drawing current even when
it is biased negatively. I didn't think grids could do that if they were
held below ground, but there is no other explanation I have for why the
grid voltage drifts in the positive direction against the pull of the
bias network.

And this is the point at which I'm stuck. Despite my affection for firebottle
rigs, I don't know enough about tube behavior to know what these symptoms
are trying to tell me. So, HW-101 experts and vacuum tube experts, what
does this all mean? What kind of operating condition can cause a tube to
seem to draw grid current when the grid is held below ground in what should
be a near cutoff condition?

Thanks in advance for any suggestions.

>With the supplied rubber duck, I notice few intermods.

Well, in general, an HT is designed to work with a rubber duck antenna. If you connect it to an external antenna, intermod will generally be a problem on almost all HTs. (I don't believe intermod is the correct term here, so let's just call it "spurious signals".) I am not familiar with the Icom u2AT, but I believe that it is a single band model, and I don't believe that it has extended receive capability. (I could be wrong on this though.)

The FT-470 is a dual bander with extended receive. (Frankly, I think that extended receive is a marketing gimmick that adds nothing to the value of the radio but opens it up to spurious signal problems.) If you get something, you give up something. In this case, you get extended receive and give up the scan function when the unit is connected to an external antenna because of spurious signals.

I use the FT-470 in my car, and I get the problems you discuss. However, I don't expect it to work like a rig designed for an external antenna such as a regular 2m mobile. My handheld scanner has the same problems.

>his 4-banger in for the 6-cylinder model and is now operating full power
>with no problems.
...

Guess I started the latest round of discussion on the 92 Camry without
being aware of the same thread back in March. Reading news is a hit/miss
time-available sort of activity and I missed the March discussions but have
since retrieved that round from the archives at ucsd.edu. However, I received
some interesting comment directly to my post. The summary follows.

Special thanks to Ed Hare at ARRL who is hawking the manufacturers to
get explicit responses to amateur concerns over the recent rash of warnings
(not just Toyota) on using two-way radios. Hams are having varying
problems so there is some substance behind the warnings for new autos
as is evident below and was evident from John Harmon's initial 92
Camry (4 cylinder). In Harmon's documentation of his problems (thanks Ed)
and in relating other's experiences he mentions certain rig/antenna
locations and power levels that caused a "computer alarm". I am
curious what indicates a computer alarm. Don't believe my dash has a
lighted symbol for computer alarm... :-)

From: ren@rap.ucar.edu (Ren Tescher)

Were you on the net this past winter? A thread at that time
was about Toyota on-board computers failing when transmitters
were keyed up. By failing, I mean either the engine died or
the ABS activated. (temporary but hazardous)
ren n0pvi

++++++++++++++++++++++++++
From: pillera@erim.org (Joe Pillera)

Don't do it! A friend of mine installed a radio in one, and it fried a computer chip in the engine - costing him over a $1,000 to replace.

++++++++++++++++++++++++++
From: rtripi@hbiso.ma30.bull.com (Robert Tripi)

I have a 92 carolla wagon and saw the same warning. The dealer gave me a copy of the shop manual that showed where the computers were and how far to stay away. He also said that they had installed a bunch of cellular phone in toyotas without problems by putting the ant on the back window. anything over 10 watts is a problem. you have to be about a foot away from the computers (in the console in my car) and they say keep the power and ant leads away from the computer leads. Putting the rig on the front seat or in the trunk should be ok if you mount the ant in the back of the car. ask your dealer to let you look at the shop manual

++++++++++++++++++++++++++++++
From: William McFadden <wmcfadde@oucsace.cs.ohiou.edu>

I don't own a Camry, but I thought you might find some interest in knowing that the Georgetown, KY police drive Camry cruisers. Certainly they must have 2-way radios! (The Toyota plant is in Georgetown, and I have family living there.)

I recently bought a '92 Honda, and its manual said to consult the service manager before installing a transmitter. I did, and he knew nothing about it, and could find no tech-sheets on it. I installed my 2m rig, an old Icom '27A, a 25 watt rig, and have had no trouble. In fact, I think it is the best installation in a car I've ever had. I have far less computer generated noise in the receiver than I had in my Renaults. The Honda also has an airbag, and it hasn't yet deployed.

Good luck in your quest for information!

++++++++++++++++++++++++++++++
From: rtripi@hbiso.ma30.bull.com (Robert Tripi)

No air bag/don't think its an option. the sensors for the bags are usually fired by sensors that track change of speed over time. They could be driven by the computer. I think that getting away from the console should do it. Dealer indicated that some of the cars they put phones in were type with air bags, so you should be ok

++++++++++++++++++++++++++
From: Ken Wyatt <kenw@col.hp.com>

My Subaru SVX is probably more realistic. They merely caution the user to not install radios near the airbag controller. I plan to mount my high-power radio (10-50 watts) in the trunk (when I get one!), using double-shielded coax cable. I know of one other person who has mounted a cellular phone in the car without problem. I have also used a handheld dual-bander in the drivers seat without incident.

++++++++++++++++++++++++++++++
From: Dave Jenkins <djenkins@wang.com>

I have a 91 Toyota Camry and the owner's manual says the same thing.
Actually (from memory) it says something about not putting a rig in
without checking with the dealer for "special precautions". As usual
the dealer was doing well to know where he works, never mind anything
the least bit technical. In my zeal (when I got my ticket in June) I
went ahead and did it without even thinking about it. You may find this
hard to believe, but, I'm not posative, I don't THINK I have an air-bag.

I am running a Radio Shack HTX-202. I had it in the cup holder on the
console (behind the shift). With the lighter plug it puts out 6W, I use a
5/8 mag mount in the center of the roof and the coax is just run next to my
seat and up along the door and out (being crimped by the door).

I have also used it (@ 6W) with the duck and the mag-mount, sitting in an
on-the-door ($.69) hanging cup holder. A friend of mine (no authority, but,
usually right) said that the "special precautions" are don't exceed 10W or
you will toast the on-board computer (rumored to be $1200).

I, like the other guy who posted, am rather concerned about when somebody
keys up his 1500W HF rig in the car next to me. Then I will be hard pressed
to say that it wasn't my 6W HT.

I would be VERY interested in anything you find out about this.

++++++++++++++++++++++++++++++++++
From: Dale Mosby <dale@sequent.com>

I don't have a Camry, but my wife and I have toyotas. I used Larson
NMO mounts with dual shielded cable (Larson NMO-DS I think is the
part number) and so have through the roof antennas. Dual band
rigs are under passenger seat with control head on dash.

No air bags in the car, but no problems with the electrical stuff
that is there. I think with the dual sheilded coax there would be
less RF floating around than with a portable cell phone in use
inside the car.

++++++++++++++++++++++++++
From: mal@cosmid.apldbio.com (Mal Raff)

Yeah...I also read the technical manual (its BIG) for my MR2 (1991/2).
I installed a Kenwood TM731 on the right side of the shift-console using
a bungee cord to hold it against the side of the console. The coax is routed
under the right side floor mat, up the door jamb, tied to the courtesy
strap and over to the 1/4 wave 440 window-mount antenna (front window). The
manual claimed the antenna should be mounted far from the main computer, then
proceeded to show it mounted to the rear window which is just above the
engine (where the main computer lives). You figure?

Like you I was not intrepid when I first tried it out. I used LOW
power and sat in the right seat :-) !! That was fine. I then tried HIGH
power (what's that....about 30 watts?) from the same location with similar

results.....no problem. I've run the thing this way for a year now. I rarely use 2 meters (the window mount is a single bander, 440 only) so I can't speak to that band. I do occassionally use LOW power on 2 meters when I'm close enough for the 440 1/4 wave to put out enough signal to be heard.

The only annoyance is that some fan turns on from time to time and makes an obnoxious grinding noise on various freqencies on the 2 meter band. Other than that, its worked out fine. Toyota does NOT have a very good policy about radios (cellular as well). I doubt there are enough potential users to put much pressure on them. I took an HT to the dealer to see if I could fail the MR2 before I bought it. Figured that if I could put the antenna right up to the computer(s) and it worked OK I was probably safe. Seems to be true.

Hi. I'm looking for mods to the Kenwood TH28A to extend the RX/TX range. I've looked at ham.njit.edu and would like to find something similar to what's posted there for the TH27A. So far, all of my searching has turned up only a comment about aircraft frequencies, so my guess is that the 28 is still too new.

Please respond directly to me.

Thanks!

> John
> N9QGW

There is a major error in the TH27A manual. The appropriate sections
should read:

4-7.3 After the DTMF code is entered, press the PAG DTSS key...

4-7.4 NOTES If you enter the wrong number, press the CALL key...

In my manual this is on page 31. This should take care of your problem.
If not, mail directly to me:

I've had my DJ-F1T for about 3 months now and am satisfied with it.
My DJ-F1T was on the seat beside me when my pickup assaulted a concrete
bridge rail at 50 MPH (hydroplaning strikes again). I found the HT on the
floor with its battery beside it and figured it was history. A couple of
days later I took a look at it, reseated the removable circuit board and
reinstalled the battery and it is working fine. Thanks to my shoulder-belt,
I'm working fine too.

Source record: 286370

Warning - A somewhat long ramble...

I would like to second Al's (N1AL) suggestion in regards to articles on Net/Rom, TCP/IP, etc . I appreciate the information which is presently contained in QST - since I presently reside in a region of Canada where technical information is very HARD to come by (even past issues of QST, and where past issues of Communications Quarterly, Ham Radio etc do NOT exist). I would like to see a moderately technical description of modems past, present and future - how do they function , what are the technical aspects of future digital mode development etc. What are the technical aspects of the various modes in relation to each other, what are their advantages and disadvantages on HF, VHF, UHF etc, how are they currently implemented and what are the plans for the future.... Some of this may be in the ARRL Computer Conference Proceedings - but I am not sure.

A second suggestion would be to take the recent article on Mixers for example and develop an increasingly technical series of articles. EG...

A second artice could discuss analogue/tube and digital implementations and how IF frequency in rigs are subject to modifications - IF shift etc for example. Then the series could examine how each of the major rigs currently do these tasks (comparisons), the advantages and disadvantages of each and then a more technical article for those who wish to use the ideas in home - brew rigs etc.

This could be done for each of the major stages of a piece of equipment providing beginners, basic and advanced readers with a developing piece of work which could nmeet technical needs of members as well as provide information on how and why those old and new rigs operate SO WELL on CW , PHONE - AM, FM and SSB and even all the Digital Modes (hope I didn't miss one - no flames please).

As a Canadian member of the CRRL (soon to change as well) I appreciate the information which I do receive in QST. I would like to thank the editorial and other staff for a good job of trying to meet everones needs all at once in each issue :-)

I too have a Ford Explorer, which I love, with one exception. Whenever I keyup
my Xcvr, the cruise control drops out, only to return to normal once I unkey.
Ford did send me some paperwork designed to help alleviate this problem, but I
have not tried it. It was a little more complex than the simple diagram that
GM sends out and, which is also published in Hints &Kinks.
I'm sure you are aware that the brain box is located behind the wall panel on
the passenger side of the vehicle. I routed my 12v wireing directly adjacent t
that box (I didn't know what it was when I wired it up, Hi) The idea, I guess,is to keep
the RF as far away from that box as possible, including routing the coax away from all
wiring too. This is a bit more difficult when putting the
thru the roof NMO connector adjacent to the dome lite (that was my thought too).The GM
drawing shows the antenna in the middle of the roof or close and I guess
the Coax would drop in the doorpost area, but the 12 wiring all goes thru the
firewall (or thru the floor to travel along the frame) on the DRIVERS side,
across the front of the radiator to the battery, at which point it is fused.
As mentionde, I haven't tried it, but all literature I have seen suggested it. I also
wonder if toroids on the computer wires might help.

>a cheap and easy way to work satellites. Thanks for any help here!
>
>Jeff
Well, I've been working mode K thru RS-12 with an IC-725 for transmit
with a 40 meter dipole antenna. For receive a HTX-100 with a ground
mounted quarter wave vertical. Works fine - usually need only about 25
watts uplink to hear good signal on downlink. You don't need separate
RX for downlink - just use two "vfo" capability of most modern rigs to
TX 21.21 -> 21.24 RX 29.41 -> 29.44 the 15 meter TX antenna will do OK
for RX as well. There is usually some activity on almost every pass - I've
worked about 50 different calls in the past 6 months.

You need to know when the bird is in view - best way is to join AMSAT and
get a copy of Bob's QuickTrack 4 tracking program for PC. The orbit data
is regularly posted here by Dr. Kelso and also usually available via packet.
However, one fellow told me that he just parks his RX on 29.407 and waits for
the beacon to break the squelch! Usually have good signals for about 10 to 15
minutes each pass and at least two passes per day at reasonable times.

So far as I know RS-12 is the only currently active mode K bird but I
think RS-10 -> RS-13 packages all have the capability. RS-10 is currently
active mode A uplink just below 146 MHz and downlink 29.36 - 29.4. I use
a converted Johnson Viking 6N2 at 60 W to a 2M J on the roof for uplink.
This bird is as easy to use as RS-12 - many users of RS-12 are also on RS-10.

73 and hope to see you on RS-12 de Ed - K9JMA.

> 2 meter only radio in a small package.

I called Yaesu and discussed the situation with them and they indicated that at some point in the past they had optimized the sensitivity and that the intermod performance had been affected. They indicated that the "fix" for this problem was to bottom out the coil slugs in T2001, T2002 and T2003 and to spread the turns on coil L2030. This in effect detunes the front end filter on VHF and reduces the sensitivity. I don't feel this is a desireable "fix" since I will be using the "rubber dummy load" most of the time.

As far as comparing it to a 2M only rig being unfair, that is probably true in some cases, however in the case of my u2AT, its front end is actually wider than the Yaesu's (much better sensitivity at the NOAA frequency here of 162.4) and the sensitivity in the 2M band is identical to that of the Yaesu.

> This is another tradeoff Yaesu made. To get good
> intermod performance in a wideband front end amplifier, high standing
> currents are required. Really stiff front ends in some base and mobile

> to extend battery life in monitoring usage, and they succeeded admirably,
> they don't use a stiff RF front end. That leads to more intermod, especially
> when used with an outside antenna.

I haven't seen the schematic of the u2AT lately, so I don't remember what its front end is like, however looking at the 470's shows that the input amplifier is biased between 2.3 and 6.4 mA, depending on the beta of the transisitors. It is a cascode amplifier with about 2 volts Vce on each transistor (again dependent upon beta - my range assumed here is 75 to 300). This could very well be the source of the intermod, however the mixer is also suspect since the intermod performance depends upon the offset of the two interfering signals and the impedance that is most frequency selective is that of the IF filter that follows the mixer.

As far as current consumption is concerned, if you turn off the SAVE feature and only have VHF active, the receiver draws 60mA squelched and about 90mA fully quieted on a dead carrier. Compared to other handhelds I have had experience with this isn't low. The battery life is primarily due to the SAVE function. I have noticed that signals that produce only about half scale on the S meter take several seconds to be recognized while using SAVE

at its default setting. It is very possible that a simplex signal at this level would never break the squelch if SAVE was in use.

> If you want a radio with a great user interface, low battery consumption
> and excellent sensitivity, all in a relatively small package, the FT-470
> is a great radio.

> Gary KE4ZV

I agree that the 470 is a nice radio, and I am sure that I am being somewhat overcritical, but I am sure that its performance can be improved without sacrificing a lot of current consumption. Once the warranty period has expired I will probably try to do that. If anybody has succeeded in doing this I would sure like to hear from them.

The Yaesu service department was anxious to help me once I got through to them, and they faxed a copy of several pages from the service manual to show me how to take the radio apart to do the "fix" mentioned above. They seemed very "customer conscious" which was refreshing.

After experiencing similar problems with my HW-101, I wrote to Heath for some help. Here's their suggestions from a letter sent to me January 11, 1980:

o Change R106 to 33K, 1W
Change R107 to 100K, 1W

o Check Relay #2 contacts for dirt, carbon, etc. between sets of
contacts as well as individual contacts.

Following their advice cured my problems. Good luck!

73,

Source record: 286286

As long as we are sharing DJ-F1 horror stories.:-)

Mine fell out of my pack on my bike. I heard a strange noise but
I couldn't stop at that moment because I was already blocking traffic.
I drug my DJ-F1, by the antenna connector, for 50 feet at about 16
mph behind my bike. The radio literally bouncing off the pavement
over and over. I have one small gouge and a few small scratches. The
radio works fine.

My wife seems to drop hers on the driveway about once/week. We finally
got her a soft case to at least cut down on scratches. A friend of mine
has ridden through many rain storms with his. I think you need plastic
explosives carefully placed to hurt this radio.:-)

1698. Re: QST Content Revisited

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 15:47:54 UTC
From: martin@datacomm.ucc.okstate.edu
Message-ID: <1992Aug4.154754.5362@unx.ucc.okstate.edu>
Source record: 286285

I want to comment on the "QST" content from a little different perspective. I get the edition of "QST" which is recorded on Talkingbook record for the National Library Service for the Blind and Physically Handicapped. It is the only technical magazine of its kind available in that form. My most favorite articles are the technical theory kind. A good example was a series which was done in 1980 about op amps. I believe it was called "A beginners Look at Op Amps." I subsequently built several circuits from that series and feel like I learned a lot.
Blind hams can and do build pieces of equipment, but we do it differently. Very complex circuit descriptions are hard to follow, but the readers on the Talkingbook records do a good job of trying to describe a circuit in a logical way. Still, the best articles are concept articles in which one can design a circuit based on the knowledge gained from reading the article.
In my oppenion, the best information is related to technical subjects, historical, and regulatory news. Narative accounts of public service and disastor recovery are also quite interesting.
Least interesting, to me, are contest and QSL related articles.
I got into ham radio to learn what made things tick or to make them tick better. If it weren't for the technology and the possibility of being of some use in times of disastor, I probably wouldn't have gotten in to it.
Keep those DSP articles coming.

I am interested in purchasing a 2m/70cm. Important features I am looking
for are at least 20 memories, tone squelch, CTCSS, DTMF decode/encode,
and stability.

I am considering Icom IC-24AT, Yeasu FT-470, Kenwood TH78A, Alinco DJ-580.
I have received some literature, but am having a very difficult time
figuring about the differences between the features on these different
radios. Thank you for your patience and your information.

1703. Re: data compression with packet: legal?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 16:41:03 UTC
From: brian@ucsd.edu
Message-ID: <15mbuvINNd7v@network.ucsd.edu>
Source record: 286282
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

Legal. The people I've contacted, including those at the League, say they've never heard of any ruling or policy that precludes encrypted data.

In particular, the League's never heard of any FCC citation being issued, and they do seem to keep track of that sort of thing.*

Urban legend.
- Brian

* Look, the ARRL does do some good things. Their technical and administrative people are good. It's the political leadership of the League that needs to be replaced.

There is a place in Nebraska (Surplus Sales) that sells *lots* of Collins parts but the prices are beyond ridiculous. Try $35 for a small knob!!!

They also had some manuals. I think they were in the $50-75 range.

But if you are willing to pay.... They can be had.

1709. Re: PRO scanner anomally

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 18:16:00 UTC
From: rpo@trsvax.tandy.com
Message-ID: <1787700016@trsvax>
Source record: 286318

This is a 'normal' condition for most hand-held scanners. What
you are hearing is an 'image' of the original transmission,
21.4 MHz off of the original transmission frequency. The image
is going to be at 2X the Intermediate frequency (in this and
most hand-helds this is 10.7 MHz). Some Uniden scanners, I believe,
and the Realistic PRO-43 use an IF of >600 MHz, and do not
suffer from this type of interference.

For a basic explanation/description, refer to the Owner's Manual
for any Realistic ('PRO') handheld scanner. Refer to the section
entitled 'Typical Band Usage' in the back part of the manual.

1710. My List of Mail Order Electronics Companies

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 18:36:50 UTC
From: jfw@ksr.com
Message-ID: <14432@ksr.com>
Source record: 286297
Cross-posted to: sci.electronics,rec.radio.amateur.misc

[$Revision: 2.10 $; last updated 4 August 1992]

Here is my list of companies which will sell electronic components in small quantities. Most of these places I have bought from, a couple I haven't. Being a ham radio operator, I am most interested in RF components, and in particular, air variable capacitors, which tend to be scarce (and tend to be used or surplus even if I've otherwise labelled the seller as "NEW"). I apologize in advance for disparaging remarks about what happens when parts suppliers start selling computers, but anyone who has watched Jameco over the years will know just what I mean (though their latest catalog hints at possibly returning to selling parts).

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment. Ideal for stocking the junkbox, usually have dependable stock lines of resistors, capacitors, and some semiconductors, but won't have those LCD modules forever... An invaluable resource, don't shy away from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality, I suppose. Intended to honor one or two ham spare-bedroom operations.
PUBLICATIONS Two publications which are essentially all want-ads, plus the address for SAMS PHOTOFACTS because everyone always asks about it on sci.electronics.

Note on shipping costs: I don't always update these frequently enough, and they're generally for continental US unless otherwise mentioned.

NEW COMPONENTS:

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
(800)-866-6626 (orders)
(401)-596-3080
(401)-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils.

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.

Pelham NH 03076 Pelham NH 03076
(603) 635-2235
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. Send $1 for the catalog (but note that they are currently (12-June-92) out of catalogs and it will probably be months before the next one is ready).

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
(800) 528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20). When ordering, you may want to be sure to ask about availability and shipping locations; they have several warehouses, and frequently orders will get sent from several warehouses (which drives up the shipping costs).

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
1-800-DIGI-KEY
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602N), but they do have blue LEDs.

Active Electronics
11 Cummings Park 237 Hymus Blvd
Woburn MA 01801 Pointe Claire, Quebec, H9R 5C7
(800)-677-8899 (US)
(800)-363-6592 (Canada) [Not listed in current catalog, try US number]
$25 minimum, $5 S&H UPS, catalog has a "$10 Suggested retail price" but they sent mine for free. They have 8 stores in the US (Santa Clara CA; Chicago IL; Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 10 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Toronto; Edmonton; Vancouver BC). Lots of stuff, oriented more toward supplying last-minute requirements of companies than hobbyists, but perfectly happy to take your money in small doses (stores have

no minimum order). The $25 minimum for certain items is no longer explicit, but they note that some items will "ship in factory minimum package quantities", which might be worse.

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
(312) 784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1248 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets.

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division
1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
(800) 93-ARROW
Minimum $25; they no longer have a catalog. They are a Real Distributor, but also didn't mind my placing a personal order (a couple of years ago).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
(800) 543-4330
Minimum $20 ($25 for charge cards, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Hauppauge NY 11788-5134
(800)695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
(800) 831-4242
(800) 237-6948 (FAX)
(415) 592-8097

$30 minimum order (was $50), >$5 shipping & handling. Their most recent catalog may have reversed a long trend of abandoning parts in favor of PC compatibles, or it may not; one can always hope.

JDR Microdevices
2233 Branham Lane
San Jose CA 95124
Orders: 800-538-5000
Cust. Service: 800-538-5001
No minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components; indeed, they recently dropped their minimum order requirement entirely.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
(408)257-8614 (408)996-3240
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
(800) 423-0070 (orders)
(602) 945-7736 (stock/price checks)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling.
Wide array of ICs, good assortment of electronic components.

EasyTech Inc
2917 Bayview Drive
Fremont CA 94538-9932
(800) 582-4044 (orders)
(510) 770-2345 (customer Service)
Apparently a brand new company, "dedicated to serving the Electronic Enthusiast/User." $10 minimum, UPS shipping is 5% of order (>= $3).

International Components Corporation
1803 NW Lincoln Way
Toledo OR 97391-1014
(800)325-0101 (US & Canada)
(503) 336-4400 (FAX)
Cabinets&Enclosures; Capacitors; Diodes; ICs; Potentiometers; Resistors; Sockets; Transistors; Books. No minimum order, $2 handling under $25.

Kelvin Electronics
7 Fairchild Ave.
Plainview NY 11803
(800) 645-9212
(516) 349-7620
(516) 349-7830 (FAX)
Minimum order $20; S&H 5% of order ($5 minimum, extra for large stuff,

overnight, export (like to Hawaii :-), and etchant; based on UPS charges).
Lots of electronic parts & tools, some robotics supplies, model rockets.

H & R Company (Herbach and Rademan)
18 Canal Street, P.O.Box 122
Bristol PA 19007-0122
(800) 848-8001 (Orders)
(215) 788-5583
(215) 788-9577 (FAX)
Minimum order $25 ($5 processing charge under $25), shipping $4.75 under $30;
Most items are new overstocks, much regularly stocked stuff as well. Tools,
electrical supplies, motors, mechanical components, robotic components.

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567
Van Nuys CA 91408-0567
(800) 826-5432
$10 minimum, $3.50 S&H. New and surplus electronics.

Alltronics
2300 Zanker Road
San Jose CA 95131
(408) 943-9773
(408) 943-9776 FAX
Surplus electronics. $12 minimum, shipping per UPS.

American Science and Surplus (formerly JerryCo)
601 Linden Place
Evanston IL 60202
(708) 475-8440
Surplus. *The* surplus place. Lots and lots of surplus. WWII gun cameras,
velcro, laser disk chassis, 6 volt VW wipers motors, LEDs, rubber brains,
you name it, they've had it. Catalogs are a really good time.
$12.50 minimum order (which includes the $4 shipping charge).

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
(214) 343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30,
$2.90 shipping (extra for Alaska & Hawaii). Surplus electronics, pretty
random looking assortment.

Fair Radio Sales
P. O. Box 1105
1016 E Eureka St.
Lima OH 45802
(419) 227-6573
Surplus electronics. Heavy on parts for old Collins gear.

Hosfelt Electronics
2700 Sunset Blvd.
Steubenville OH 43952
(800) 524-6464
No minimum, $3.75 S&H. Surplus electronics.

HSC Electronic Supply (Halted Specialties Co.)
3500 Ryder Street
Santa Clara, CA 95051
(800) 4-HALTED Orders only
(408) 732-1573 inside California and outside US
Surplus (new) electronics; new and used test equipment. Minimum order $10
($2 handling charge under $20), plus UPS shipping cost. Has three stores,
of which 3500 Ryder Street is one.

Marlin P. Jones & Assoc.
P.O. Box 12685
Lake Park FL 33403-0685
(407) 848-8236
No minimum ($1 fee for under $10), shipping per UPS. Surplus electronics.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
orders: (800) 642-1123 (tues - fri 9am-4pm sat. 9am-3pm EST)
info: (216) 621-1121
$10 minimum. Surplus electronics.
"Also known to stock many components, but this is not discussed in the catalog.
Local store, a cleveland institution, is called Electronic Surplus, Inc., and
has been there since '48. Third generation now runs it." -- wb8foz

Surplus Sales of Nebraska
1315 Jones Street
Omaha, Nebraska 68102
(402) 346-4750
(402) 346-2939 (FAX)
New and surplus radio electronics. Wide selection: air variables.
Catalog $3 (free with order, refundable with $25 catalog purchase).

Tucker Surplus Store
1717 Reserve St.
Garland TX 75042
(800) 527-4642 extension 135
Surplus electronic gear; oscilloscopes and signal generators from the days
when dinosaurs with vacuum tubes roamed the earth (some solid state gear, but
all well used). Prices seem relatively high, and you'll be shocked to learn
how much it costs to ship a 75 pound oscilloscope by motor freight...
[Steve Brown, N8HFI:
In defense of Tucker, the have a broad selection, repair facilities, and
they certify the used equipment to meet the original specification and
warranty it for 90 days. Not every source does this:]

Davilyn Corp.
13406 Saticoy St.
North Hollywood, CA 91605-3475
1-800-235-6222 (Ex. CA)
1-818-787-3334 (CA)
1-818-787-4732 (FAX)
Surplus electronic gear.
[has much better prices [than Tucker], but sells used equipment as-is. -N8HFI]

SPECIALTY COMPONENTS:

JAN Crystals
2341 Crystal Drive
P.O. Box 06017
Fort Myers FL 33906-6017
(800) JAN-XTAL (Monday through Thursday)
They make crystals. Minimum order is $10, which might be one crystal, or
might be two.

Crystek Corporation
2351/2371 Crystal Drive
P.O. Box 06135
Fort Myers FL 33906-6135
(800) 237-3061 (M-F)
They make crystals too. They were the cheapest last time I ordered, but
I don't have an up-to-date price list. It took about 4 weeks, and they
had said it would take 6.

ICM (International Crystal Manufacturing Co., Inc.)
701 W. Sheridan
PO Box 26330
Oklahoma City OK 73126-0330
(800) 426-9825
More crystals. They were more expensive, but they have lots of pre-made
crystals for various rigs, so they would probably be faster.

Amidon Associates
2216 East Gladwick Street
Dominiguez Hills, CA 90220
(213) 763-5770
(213) 763-2250 (FAX)
Toroid cores and related things. Very fast service. Now takes MC/Visa and
phone orders.

Palomar Engineers
Box 455
Escondido CA 92033
(619) 747-3343
Toroid cores and shielding beads.

K2AW's Silicon Alley
175 Friends Lane
Westbury NY 11590

516-334-7024
Free catalog, $10 minimum order. Semiconductors, in particular high-voltage diodes.

Small Parts, Inc. [New address and phone, 23 Dec 91]
13980 NW 58th Court
P.O. Box 4650
Miami Lakes, FL 33014-0650
(305) 557-8222 Order department
(305) 557-7955 Customer Service (ask for Mirta)
(305) 558-1255 Catalog (ask for Elizabeth)
(305) 557-8004 Custom-made Parts (ask for Ziggy)
(305) 557-8005 Non-standard Sizes
of catalog parts (ask for Eric)
(800) 423-9009 Toll free FAX line
$12 minimum. Mechanical parts, metal stock, Teflon(R) sheets, tools, wire-size drill bits (as in #61 size for PC board holes).

KITS:
(The terse "Note:" descriptions are from the ARRL Kit List courteously supplied by Ed Hare and Mike Gruber at the ARRL.)

624 Kits
171 Springlake Drive
Spartanburg SC 29302
QRP kits (including some designs from W1FB's books) and some parts.

A&A Engineering
2521 W. LaPalma, Unit K
Anaheim CA 92801
(714) 952-2114
Kits, some components, some books. S&H $4.50, catalog is free with SASE (2 oz postage).

Antique Electronic Supply
6221 S. Maple Ave.
Tempe, AZ 85283
(602) 820-5411
Note: Broadcast receiver kits

Circuit Board Specialists
P. O. Box 951
Pueblo CO 81002
(303) 542-4525
As the name implies, they specialize in circuit boards; they have circuit boards for a variety of QST articles and ARRL Handbook construction articles. They also have partial kits for most of their boards. The catalog is free, but I had to request it a couple of times.

C.M. Howes Communications
Eydon, Daventry,
Northants NN11 6PT

England
Phone: +44 327 60178
Note: QRP, transmitters, receivers, misc.

Communications Concepts Inc.
121 Brown Street
Dayton, Ohio 45402
(513) 220-9677
kits for Motorola Applications Notes (amplifiers and the like), small assortment of components (chip capacitors, transistors).

Down East Microwave
Box 2310, RR#1
Troy, ME 04987
(207) 948-3741
Note: Microwave preamps

FAR Circuits
18N640 Field Court
Dundee IL 60118
Printed circuit boards for articles in the usual ham magazines. SASE for list. $1.50 shipping and handling per four boards.

Hamtronics, Inc.
65 Moul Road
Hilton, NY 14468-9535
(716) 392-9430
Note: Amateur, general interest

John Langner WB2OSZ
115 Stedman St.
Chelmsford, MA 01824-1823
(508) 256 6907
Slow Scan Television for IBM PC.

Lake Electronics
7 Middleton Close
Nuthall
Nottingham NG16 1BX
England
Note: Amateur

Mercury Systems
15 Lakeside Dr.
Marlton, NJ 08053
1-609-596-3304
Note: the ARRL Kit list didn't say what they carry; I don't (yet) know either.

Penntek Electronics
14 Peace Dr.
Lewistown, PA 17044
(717) 248-2507

Note: The Neophyte Receiver, QST

Ramsey Electronics
793 Canning Parkway
Victor NY 14564
(716) 924-4560
Amateur radio and hobby kits. The ham kits are all pretty simple and pretty inexpensive, and you get about what you pay for. Their new VHF transceiver kits (144, 220, 440) look pretty interesting. Many have complained about the quality of their kits, though.

{See also RadioKit, Oak Hills Research}

LITTLE GUYS:

Oak Hills Research
20879 Madison St.
Big Rapids, MI 49307
Send $1 for a flyer. Some parts, QST article kits, transceiver kits, QRP stuff in general (they inherited the stock from Small Parts Center when they closed).

KA7QJY Components
Danny Stevig
Box 3893
Logan UT 84321
(801) 753 5961
Send a business-size SASE for a current list of parts. RF parts, including vernier drives and air variables. $2.75 shipping, no minimum. Fast service, lots of satisfied customers.

R&R Associates
3106 Glendon Avenue
Los Angeles, CA 90034
(213) 474-1315 (res)
[Richard Rathburn, KB6NQ] "I mainly sell pc boards from QST, Radio Electronics, etc., and a few of in-house design. I also sell IC's, etc." Send a SASE every now and then for his most recent flyer. He also has boards for some Motorola Application Notes.

MANUALS:
Eico Electronic Instruments Co., Inc.
363 Merrick Rd
Lynbrook NY 11563
Note: No current kits, EICO manuals and schematics only

PUBLICATIONS:

NUTS & VOLTS MAGAZINE

1711. Re: Neophyte wants a 2m/70cm. Please Help

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 18:36:59 UTC
From: ron@pilot.njin.net
Message-ID: <Aug.4.14.36.59.1992.8657@pilot.njin.net>
Source record: 286294

The 24AT does not receive both bands at the same time. The ICOM W2A does (you didn't list it). Both the W2A are smaller than the Yaesu (not by much) and much smaller than the TH78A. The FT470 also comes standard with PL encode/decode while the 24AT does not. The 24AT has a wider receive range however.

-Ron

1712. Re: QST Content Revisited

Newsgroup: rec.radio.amateur.misc

Message-ID: <1992Aug4.184302.27331@news.acns.nwu.edu>
Source record: 286293

My suggestion for improving the already excellent QST:

MORE TECHNICAL ARTICLES PLEASE

Enough of the art (but no science) of building a Copper Cactus, endless lists of World Wide contests or intricacies of making an optic fiber cable connection.# Yes! Throw in the mathematics and engineering. Put it in a side bar if needs be but at least have it in there.

I have my flame retardant suit on!!

Rajiv
aa9ch
100% cw
r-dewan@nwu.edu

Any resemblance to a list of recent articles in 73, CQ and Communications Quartely is intentional. BTW, the largest article by far, in number of words, in 73 is Wayne Green's inane commentary. I would much rather see ads or even contest lists instead.

In rec.radio.amateur.misc, gary@ke4zv.uucp (Gary Coffman) writes:

>I'd like to see more
>articles describing construction projects that go more in depth as to
>*why* a circuit design was used as well as *how* it was done. There
>is some beginner level material like this, but little *advanced*
>material of this kind. Chocolate milk and cookies are fine, but
>sometimes we'd like to see some steak.

I agree completely. Most readers will never build the project exactly
as described in QST, so detailed construction info is less important
than the ideas behind the design.

Hello:
Does anybody have TI-99/4A equipment? Looking for stuff beyond the basic setup.
Please respond via e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU.
Thanks.

1715. DXpeditions Working By Call Areas

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 19:35:35 UTC
From: jkearman@arrl.org
Message-ID: <361@arrl.org>
Source record: 286319

I'm going to get torched for this, but.....
DXing is a sport, and very competitive. If you
want to do well, you have to commit yourself to
it. The committment is in time and money. You
wouldn't expect to enter the Indy 500 with the
family car, and you shouldn't expect to make it
to the DXCC Honor Roll with a half-baked signal.

To my way of thinking, trying to level the field,
as some of these proposals purport to do, is
akin to socialism. Instead of elevating those who
are willing to make an effort, you drag everyone
down to a lowest-common-denominator level.

I disagree that DXpeditions should be "fair" to
all. If your station isn't competitive, don't
expect to break pileups as if it was. Work on
your operating skills and save your money for
a better antenna system.

Operating skill is cheap to acquire. You can
read and follow the hints in The DXCC Companion
and The Complete DXer. Bob Locher himself says
that you make your own goals as a DXer. I agree.
You should, however, set goals you can achieve.
Randy Rand, AA2U, has accomplished 7-Band DXCC
with QRP. I believe he did it--Randy just hangs
in there until he gets through. KR2Q has 300
countries with QRP. Both of them have competitive
antenna systems, but their skill and patience are
certainly major factors in their success.

Some DXpeditions are disasters, and the cause is
usually the DXpedition operators' lack of skill
or experience. Why people will spend thousands of
dollars to go on a DXpedition to a rare place, and
not make any effort to learn how to operate first
is beyond me. When you run up against such an
operation, brute force is often more helpful than
skill.

Closing the door on "portables" isn't going to
solve the problem. DXpeditions should know when
there are going to be openings to places where
hams are having trouble getting through. Standing
by for 6s when propagation favors the East Coast

is silly. On the other hand, wasting a long-path opening to the West Coast by insisting on working Europe at that time, is also silly.

Unless you're going to stay at a DX location for a long time, in which case you won't be rare DX for long, you just work what you can hear best. You try to work the propagation, because it's challenging to do so, and you care enough to give everyone a shot. But wasting hours haranguing everyone, or fighting to maintain some artificial "fairness" is not smart operating. If you work 'em fast enough, the pileup goes away, or at least remains manageable.

If I go to a distant land, however, I have the right to operate as I please. If I want to give my name and QSL information to everyone I work, that's my right, isn't it? I shouldn't complain when the pileup goes berserk, though. That's reality. We need education, not regulation. I wrote an article called "Pagalu Safari," followed by the book, The DXCC Companion because I was frustrated at the poor operating practices of some DX stations and DXers. You never hear the good DXers in a pileup--they're in and out fast. I am opposed to any changes in the DXCC rules.

For all concerned, I quote Harry Truman: "If you can't take the heat, stay out of the kitchen." This may sound cruel, but who said life was fair?

73 and good DX.

Jim, KR1S

1716. Non-code Tech/Novice Tests

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 20:03:35 UTC
From: jkearman@arrl.org
Message-ID: <362@arrl.org>
Source record: 286320

Others may have posted the Novice/Tech subbands
since the original posting. I've been offline
since Friday.

Tune In The World will NOT prepare you for
the Technician written exam (element 3A).
It covers only the Novice written exam
(element 2A).

Tune In The World was replaced in 1991
with Now You're Talking! (NYT!). NYT! has
updated info from Tune In The World, plus
everything you need to know for the Tech
written exam.

True, you could get away with using Tune In
for the Novice, then use the Tech License
Manual for the Tech, but the Tech LM doesn't
have the Tech regulatory info. For the
License Manual series (as opposed to NYT!),
we refer to the FCC Rule Book for regulatory
questions. Keeps the books smaller, and, when
the rules change, we only have to modify
one book, not four.

NYT! is available at Radio Shack stores, as
well as ham dealers. We're up to the 4th
printing right now, with over 150,000 copies
in print. I think we have the best entry-level
book in the business, and I've seen 'em all.

73, Jim

1717. Perseid Meteors

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 20:46:00 UTC
From: pbrown@uwovax.uwo.ca
Message-ID: <1992Aug4.164600.1@uwovax.uwo.ca>
Source record: 286298
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

For those operating in the higher frequencies the annual
Perseid meteor shower coming up next week may be a particularly
special event.
Last year, an outburst of the Perseid's occured while
Eastern Asia was still in darkness and Japanese observers saw
one of the strongest Perseid showers in history. While the
enhanced activity only lasted about 2 hours the meteor rates
hit nearly 350/hr. Several radio operators in North America
picked up the burst in activity at about 16h UT on Aug 12, 1991.
This year, there remains the possiblity that strong
activity will once again recur. BUT, for visual observers the
shower will be somewhat diminished as a result of the nearly full
moon.
Thus, radio observations are key this year to monitor
the shower. The place along the Earth's orbit where the burst
of activity occured in 1991 will again reach the Earth on
Aug 11 at 22-23h UT. This will be daylight for North America, so
only those who are radio observing in North America will have the
chance to see if increased activity does take place.
To make your observations by radio of some value there are
a couple of simple procedures to follow. To get some idea of the
sensitivity of your setup to meteors it is worthwhile to record
meteor contacts over a period of at least an hour or so at least
on the night before and the night after the maximum of activity. Hence
to make the most of your data, it is best to record say from 22-23 UT
on Aug 10, 22-23 UT on Aug 11 and the same time again on Aug 12. Record
the number of contacts or meteor echos in each of these time intervals and
if possible observe as long as possible during the periods on either
side of these times on these nights. Keep your setup (including antenna
direction!) the same each night. Since the Perseid radiant will be low in
the NorthEast during the early evening hours from North America Northwest
-Southeast paths are most sensitive to the Perseids.
If you are able to make Perseid radio observations I would be
most interested in getting your raw results within one week of the peak.
These will go into a special report outlining the activity of the shower
as recorded by various observational techniques. Send them to:

peter@canlon.physics.uwo.ca

1718. QST Content

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 20:53:13 UTC
From: jkearman@arrl.org
Message-ID: <363@arrl.org>
Source record: 286326

Kok Chen writes: The ones that I
;wished didn't waste QST pages are the warm and fuzzy micro-novels
;(didn't you write one of those recently, Jim? :-). The worst are
;the "How knowing Morse code helped me save my dog's life" type
;articles.
;
;Kok (yeah, sure I'm a member) Chen, AA6TY kchen@apple.com
;Apple Computer, Inc.

Oh, boy. I've really stepped in the doo-doo this time. I assume
Kok is referring to "Wally and Mike." There is a rationale at
work here. So, exclusively for Internet readers, this is it:

The ARRL Board is concerned about operating practices in some
areas of the hobby. HQ was tasked with coming up with some
QST articles. I was asked to write a series of fictional pieces
that would explain operating practices. The theory here is,
fictional pieces go down easier than tutorials.

I contend that it's up to the experienced hams to
show the way. Rather than preach to the newcomers (many of
whom, unfortunately, don't join ARRL/get QST), I thought it best
to encourage patience on the part of "experienced" hams.
I hope the Wally and Mike stories will be interesting
enough to be read, and the subtle message will get through.
I freely admit to being heavily influenced by Carl and
Jerry, which ran in Popular Electronics in the late 50s and
60s. I'm having fun writing the stories. Barring a tide of
dissent, I hope to keep doing them for a few years....

1719. What do VHF colinear antennas use for phasing delay?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 21:19:17 UTC
From: rossi@gvlf9-q.gvl.unisys.com
Message-ID: <1992Aug4.211917.13615@gvl.unisys.com>
Source record: 286301

What do they use for the phasing delay for these multi-element VHF/UHF colinear antennas? I know something like the Ringo Ranger you can see the little hairpin loop but on these fiberglass jobs, what to they use?

Anyone have any designs for some good homebrew multi-element colinears?

Seems to me that they should not be all that hard to make.

;small Sony receiver but can't find the article.
;
;Anyone got such a receiver for sale?
;
;thanks and 73,
;
;Grover, WT6P

The article was "Kayaking QRP," QST for Jan 1991, pp 14-15.
The author was N7KPN, and his receiver was a Sony ICF-PRO80.
He complained about the poor selectivity. I'd recommend
one of the small QRP transceivers/kits on the market. They
have pretty good receivers, and all in one box.

73, Jim

>articles describing construction projects that go more in depth as to
>*why* a circuit design was used as well as *how* it was done. There
>is some beginner level material like this, but little *advanced*
>material of this kind. ...
>

My feelings exactly. I don't have a BSEE but I've always had an
interest in electronics and have taught myself over the years.
A major part of that education has come from reading construction
articles in various magazines.

As an example, using an XR-2211 for a RTTY demodulator has been beaten
to death in countless articles. All the articles use the same circuit
from the manufacturer's literature with little extras around the edges
such as an RS-232 level converter.

A *good* article would contain most of the following:

- What is problem to be solved?
- History (early designs with torroid LC tuned circuits).
- Alternative designs (tuned filters with op amps, Am7910, etc.).
- Weaknesses in similar designs and why this is better.
- Mistakes made and changes to arrive at final design.
- Bibliography.

When designing anything non-trivial, there are many design decisions
involving trade offs between:

- Performance.
- Reliability.
- Cost.
- Complexity.
- Ease of duplication by other people.
- Amount of tweaking required.
- etc.

Only a teeny tiny fraction of the people who see a construction article will
ever build the project described. However, by including most of the topics
above it can be educational to both the beginners and more advanced readers.

1722. ALERT: Proton Enhancement Alert at > 10 MeV

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 21:46:57 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.712964817@honte>
Source record: 286302
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

SATELLITE PROTON ENHANCEMENT ALERT

ISSUED: 21:30 UT, 04 JULY

/\

Protons at greater than 10 MeV have become slightly enhanced over the last six hours. The enhancement began near 15:00 UT and has been very gradual in nature.

The suspected source is the long-duration combined M4.8/1N and M2.3/1N flare and tenflare of 03 August from Region 7248, respectively. The character of the enhancement is typical of an east-limb source region.

At this time, it is doubtful protons at greater than 10 MeV will surpass the event threshold of 10 pfu. Protons should level off over the next 24 hours and begin a slow, gradual decay.

** End of Alert **

Gary is, as usual, quite correct. When my brother passed his Technician
license and got up on the air, he built a 40m/10m inverted V antenna.
He worked a fairly decent quantity of DX very rapidly, and swore
by his "40-10" antenna. Anyway, I'd loaned him my noise bridge but
he never felt like learning how to use it so the match on the 10m
legs was, in his words, "a little off". When I went to visit, I
was tuning up his TS-830S on 10m and the dip was really sharp, leading
me to suspect a high SWR. I used his Realistic SWR bridge and discovered
maybe a 3:1 SWR. Hmmmm... I walked out and actually looked at the
antenna; heh-heh, he'd cut the 40m legs the correct length, but he'd
cut each 10m leg to be the *total* length, i.e., twice too long. I
went and check the SWR on 20m, it was 1.1:1 at the bottom of the band.

The moral is, you can have a lousy antenna on still get a lot
of contacts when a band is red-hot.

1725. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 22:15:54 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Aug4.221554.23503@afit.af.mil>
Source record: 286304

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1727. AURORA WATCH: Middle Latitude Auroral Activity WATCH

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-04 23:29:34 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.712970974@honte>
Source record: 286311
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 23:15 UT, 04 AUGUST

/\

VALID UNTIL: 19:00 UTC ON 05 AUGUST

MODERATE RISK PERIOD: 04 - 05 August (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: LOW - MODERATE

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

SOUTHERN BRITISH COLUMBIA TO NORTHERN MONTANA TO NORTH DAKOTA TO
MINNESOTA TO WISCONSIN TO MICHIGAN TO PARTS OF NEW YORK STATE (DARK
SKY SITES) TO PARTS OF NEW HAMPSHIRE TO SOUTHERN MAINE.

SYNOPSIS...

A solar disturbance arrived at 14:08 UT on 04 August. The disturbance
has produced mildly active levels of auroral activity. At the present
time, most of the activity is concentrated over the high latitude
regions. However, there is a chance activity could intensify somewhat
over the next 12 to 18 hours. If intensification occurs, activity could
be observed over the northern tier of the U.S. states, the northern U.K.
and parts of northern Europe and the northern Siberian regions.
Activity could also become weakly visible from dark sky sites of
southern Australia and southern New Zealand.

This is not expected to be a very substantial disturbance. Auroral
activity is not expected to become visible over the lower latitudes.
High and northerly middle latitudes (north of the U.S. / Canada border)
should see most of the activity, which may be rather sporadic and
localized in nature.

Activity should begin subsiding later in the UT day of 05 August. Lunar
phase will not be a very strong factor, particularly after the moon sets
near local midnight.

This WATCH will remain active until 19:00 UT on 05 August when it will
either be updated or allowed to expire.

** End of Watch **

>figuring about the differences between the features on these different
>radios. Thank you for your patience and your information.

You should probably also look at the ICOM W2A which is selling in the
real world for about $500. It has all the features of the 24AT and
dual band receive as well. Unfortunaly, it doesn't use all the nifty
old ICOM accessories, but if this is your first rig that's not a
problem at all.

If you don't mind a piece of used equipment go find a used ICOM 32AT
w/ UT40 tone board and have phunn. The 32AT is an older piece of
equipment but is built like a battleship. Its big win over all the
new mini-ht's is audio quality. Have a bigger chassis put in a bigger
speaker...

From: dwilson@s850.mwc.EDU
Message-ID: <9208051200.AA15631@ucsd.edu>
Source record: 286324

For several months I have searched for a source of the mic
holder that resembles a hook to hold the mics that have
a piece of metal with a hole. (The other type which holds
the mics having a round ring can be bought at Radio Shack.)

I have tried HRO, etc. with no luck and often been told that
this is not the first such request of them. Some radios are
even shipped without this holder even though they need it.

I have not found a good substitute--I want metal with screws
--not plastic stick-ons I can get in home supply places.

Anyone know a source? I suspect I am not the only one in need.

In article <1787700016@trsvax>, rpo@trsvax.tandy.com writes
about images:

> Some Uniden scanners, I believe,
> and the Realistic PRO-43 use an IF of >600 MHz, and do not
> suffer from this type of interference.
>
> For a basic explanation/description, refer to the Owner's Manual
> for any Realistic ('PRO') handheld scanner. Refer to the section
> entitled 'Typical Band Usage' in the back part of the manual.
>
> Paul Opitz Radio Shack Publication

The up conversion design of the Radio Shack PRO-2004/5/6
allows use of a very high IF (intermediate frequency), which
all but eliminates image problems. Ironically, the PRO-2004/5/6
owner's manuals contain a section on images. This section
appears in the manuals for most other Radio Shack models,
and was thoughtlessly included in the PRO-2004/5/6 manuals.
It babbles on about images being 21.4 MHz away from the real
frequency -- true for simpler models, but not so for the
PRO-2004/5/6.

1740. Travelling to Canada (what are the rules?)

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-05 12:43:43 UTC
From: gmc@HELIX.NIH.GOV
Message-ID: <CMM.0.90.2.713018623.gmc@helix.nih.gov>
Source record: 286251

Hi everyone,

I'll be going to Canada at the end of the week for a few days and I was wondering what the scoop is on operating there. I will probably only be using 2 meters. A US technician license is valid for a visitor, right? Are there any special power limits? Can we use the full 144-148 MHz?

Thanks in advance for any replies.

Gordon

1741. Jon Long N8GXZ: Help me find him, he may have ripped me off!

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-05 12:55:18 UTC
From: megabyte@chinet.chi.il.us
Message-ID: <BsIH86.13w@chinet.chi.il.us>
Source record: 286179
Cross-posted to: rec.radio.amateur.misc,rec.radio.swap

Does anyone know how to get in touch with Jon Long, N8GXZ? He _used_ to
live at 804 North Meridan Rd in Youngstown, OH. However, he has moved,
left no forwarding address, and OWES ME MONEY!!!!!

See, I bought a HW-101 from him, it arrived damaged, UPS took it back.
Then Jon kept stalling me about how he was "working with UPS" on resolving
the damage claim.

Well, now his phone has been disconnected, and he has no forwarding address
with the post office. If anyone has any idea on where he is, please let me
know.

Meanwhile, if you ever have a chance to buy anything from Jon Long, N8GXZ,
I'd pass on it.

I'm working with UPS to see if he ever bothered with the damage claim.
He might have collected both my money and the insurane money and left, but
he might have not went through the hassle with UPS and maybe I can get
either the damage claim, or at least the HW-101 back. I could sell it
then and get back some of my money for this fiasco.

Any advise would be much appreciated.

Yeah, ten is like that. When it's open, you can get around the world with milliwatts. When it isn't, you can't get out of your back yard with a kW and a 6-el beam. While we're swapping stories, I once worked a G6 station from Illinois on 10. He was coming in a little weak, and I mentioned this; he said, `well, old man, it's hardly surprising; I'm running 50 milliwatts up to a dipole.' Yow.

Try giving them a call. I think I had to ask them twice for my original catalog (and they probably don't have any in stock now, anyway), but they are real, and I have seen catalogs from them :-).

> The moral is, you can have a lousy antenna on still get a lot
>of contacts when a band is red-hot.

An SWR of 3:1 does not mean lousy antenna. With the pi filter on the TS 830S,
most probably 90% or more of RF power has been radiated. Low SWR is
important for no tune rigs without tuners, or for antennas with very long
cables. As a personal note, a 20m vertical with SWR of 5:1 on 10m
worked for me 2S better on 10m than a multiband dipol with SWR 1.5:1.
The veritical had a much lower radiation angle, which more than compensated
for some losses in the verical cable.

I think it's important that those of us on packet support this effort.
It could change how well HF packet works. FYI

In accordance with the following message from the Net Manager of the
ARRL STA network now operating on 14.098 Mhz. this station will cease
operations for the 24 hour period 0000z August 8 thru 2359z August 9.
I urge all of you to contact your area director and ARRL Headquarters
if you appreciate the relay of messages on the HF networks. If the
present proposal is adopted you can forget long haul message forwarding
as it now exists..
73
Dennis W5XO
------------------------------Message from W8AKF --------------------------
SUGGEST EACH OF U DO SOMETHING LIKE THIS DE W8AKF

HI ALL - I'VE RECEIVED A MSG FROM THE GROUP OF SIX BOARD OF DIRECTORS,
SUGGESTING AS A PROTEST TO ARRL BoD ACTIONS ON 7/17/92 NOT TO SUPPORT
AUTOMATIC HF PACKET OPERATIONS TO SHUT DOWN AUGUST 8,1992, THEY FURTHER
SUGGEST EACH OF U SEND A QSL OR POST CARD TO UR ARRL DIVISION DIRECTOR SAYING
"I SUPPORT CONTINUING UNATTENDED AUTOMATIC PACKET HF FORWARDING" AND SIGN IT.
ADRESSES ARE: SWD FRIED HEYN PACIFIC CHARLES McCONNELL
962 CHEYENNE ST. 1658 W. MESA AVE.

1755. QST Revisited

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-05 14:27:17 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GN7UCK5FQ89JD3T6@TNTECH.BITNET>
Source record: 286237

In rec.radio.amateur.misc, gary@ke4zv.uucp (Gary Coffman) writes:

>I'd like to see more
>articles describing construction projects that go more in depth as to
>*why* a circuit design was used as well as *how* it was done. There
>is some beginner level material like this, but little *advanced*
>material of this kind. Chocolate milk and cookies are fine, but
>sometimes we'd like to see some steak.

!I agree completely. Most readers will never build the project exactly
!as described in QST, so detailed construction info is less important
!than the ideas behind the design.

!AL N1AL

Well I don't agree.. I am fairly new at this building things
and have very little formal education in this subject area.
The way I learn best is by 1)reading an overview in not
highly technical terms what the project does and how it goes
about it 2)build the project 3)read the technical
explanation of what is really going on in the circuit...
Seems to work for me and I am continually finding small
projects to build that are usefull to my Ham radio
operations. First thing I ever built was the CMOS memory
keyer that is now in the new handbook. I have used a number
of memory keyers in contests and like the way this one
operates the best (and like it twice as much because I built
it) I built the optical straight key and have fun with it
too. Next I am going to build the CHEAP CMOS keyer for my
QRP rig. I am looking forward to building a QRP transceiver
from one of the articles.

I find QST to be the absolute best magazine of its type. I
read it at least twice an issue and read a good portion of
the magazine. I have been into other hobbies and haven't
found a magazine of this calibre for any of them. The
magazine that you get with the AMA (Radio Controlled flying)
is a piece of garbage, spend all of 10 minutes a month
reading it.

I think people would like to mold the world to their own
liking and have such boring lives that they need to complain
a lot... guess the real world doesn't work that way. I
would like to once again thank the people in the ARRL.. they
are always most helpful, I know of no other organization
where I can E-Mail a personal question and get a quick,

polite response, even if my question only helps me and isn't really part of their jobs. Think some of the complaining people should have their bosses find small things wrong with everything they do and see how good they feel about the workd they do.

>
>Gary KE4ZV

Too true (sigh). An excellent incentive for "old techs" like me to work
on our cw and get that upgrade so we can work the lower bands.

Still, I think there's good reason to be fond of the R5....and probably the
R7.....and other such proven antennas of the vertical persuasion. Lots of
times I wouldn't have even heard the DX if I were not using an omni-directional
antenna....that's my BELIEF, not actual comparison.....my feeling is that
I will keep the vertical even when I can manage to get something directional
in the air, to listen on. I realize there's a big difference in gain, but
there's a trade-off to the extra effort it takes to spin a beam while tuning.
OK,OK....of course the beam/quad or whatever must be "better" or there
wouldn't be so many users 8^) !!

Plus, it was cheap.....and easy to put up.....and my wife didn't think it
was "too ugly".

>I'm going to get torched for this, but.....
>DXing is a sport, and very competitive. If you
>want to do well, you have to commit yourself to
>it. The committment is in time and money. You
>
>Jim, KR1S

Right on. I just started Dxing last year and I couldn't agree more with the above and the rest of Jim's posting. I also agree with the posting the other day that said a DXpedition is successful as long as it's making QSOs. But that's from the perspective of the DXpeditioner. From the DXer's standpoint...(or at least from THIS neophyte DXer's standpoint) it's like hunting or fishing where you can hardly expect the quarry to behave predictably ALL the time. Isn't that part of the attraction?
Besides, if it were made "easier" or more "fair" it would take less effort and less skill, making it less attractive....to me, anyway. I'm not much good at athletic sports, but I sure do LOVE a pile-up. The grousers might enjoy the "battle" more if they could "win" more often.....for me, that took:
(a) Reading the pro's....the books by Bob Locher and Jim Kearman were the biggest help to me. Lots of tips on operating practices that REALLY worked.
(b) Time. Time tuning and listening. Hour after hour after hour. Getting up at 5 am to listen for Africans, missing dinner at 6 pm because the Pacific is starting to come through.
(c) Jump into the pileups with the rest of them. Assert yourself....as politely as possible.....but don't be hesitant.

These things worked for me.....I've been having LOTs of fun ! But I guess I really don't care for one aspect of DXpedition practice....working split. Takes too much bandwidth. I'm only a very little pistol, but give me a good pile-up over a split operation ANY time.

Jeff, I take exception to your "prejudiced and
stupid statement" remark. As you go on to say
"Not everyone thinks the same about what is fun
in ham radio ... thats what makes ham radio so
great". With the latter comment, I can only
applaud.

Ham radio has survived, for many years, with a wide diversity of individuals, ideas, likes-'n-dislikes, interests, etc. and so it shall continue. We do need; however, to be tolerant of ideas and feelings differing from our own.

With everyone who is in favor with contruction articles, I agree. However, I have an additional request for the authors: In addition to telling me how to make something (be it an antenna or a QRP tranceiver), how about telling me why it was done that way?

True, I have gotten used to academic literature and I am not advocating pages of mathematics in QST, but I would be very interested in learning why an author chose a particular method to design something and what the alternatives were. There is very little of this type of explanation in the construction articles that I have seen in QST.

/\

MINOR GEOMAGNETIC STORM ALERT

ISSUED: 16:00 UT, 05 AUGUST

/\

ATTENTION:

A minor geomagnetic storm materialized over the last 8 hours. Activity surpassed the minor storm threshold near 09:00 UT. Minor to major storming has been observed since approximately 00:00 UT. This activity is thought to be related to a large disappearing filament that was observed on 01 August.

Activity should begin subsiding as the day progresses, although residual storm periods will likely linger over the high latitude regions for the next 18 to 24 hours. Middle latitudes should become mostly unsettled to active on 06 August.

** End of Alert **

> I have not found a good substitute--I want metal with screws

I found that taking a regular metal screw-eye (-==O) and opening
the eye with a pair of pliers to form a hook worked very well. Another
idea I used was to take a long-necked solder lug, bend the neck into
a hook shape, cover the neck with heat shrink tubing, and screw the
thing to the rig case or car's dashboard - this was a no-vibration noise
hook which worked just beautifully for several years in the car.

Hope this helps.

I'm still looking for Jon Long, but UPS has advised me that he never
bothered to contact them to file a damage claim. UPS has offered to
ship me the damaged unit for free. At least I'll be back where I started,
with a HW-101 with a broken meter and load control.

Message for Arthur Birt, call sign G3NR, of Woking, Surrey, England, from
B. Seed, VE3MJD, Ottawa, Canada.

I have been unable to keep sked on either 15 metres or 17 metres all summer.
Will try again on 15 metres in September.

Could ham radio operators reading this message please relay to
Arthur Birt and confirm.
****

Send confirmation via e-mail to MRAJAB@HPB.HWC.CA (InterNet)
OR
to B. Seed at VE3MJD via ham-radio.

Thanks,

Mustapha Rajab

One warning about Mouser is that they use your phone number as
part of your customer identification. This caused me a bit of a
problem a couple of years ago when I gave them my _office_ phone
number for my order. For the next couple of months they kept
trying to charge all of my _department's_ orders (we have only
one base number for the entire department) to _my_ account. (Why
a "couple of months"? -- Because it took me that long to figure
out what was happening and to get hold of a person at Mouser who
was in a position to make the appropriate corrections to their
computer database.)

I used 1 to 4 watts into a 2 element Quad at 28 ft. at the bottom of the sunspot cycle Fall 1985/Spring 1986. Worked great on 10 meters from Hawaii. Could call CQ on SSB and get VKs to come back. Ran JAs and VKs in the WPX SSB contest. In fact, I'd say I had more fun at the bottom of the cycle than when 10 meters was wide open. There was less QRM so my QRP signal was noticeable whenever the band opened. Sure, the band doesn't open every day at the bottom of the cycle, but it does open up, even when the Solar Flux indicates otherwise (East-West 10 Meter paths aren't suppose to open up when the SF is 72, according to some people).--Zack KH6CP/1

Let me add to what Jim, KR1S, has posted about DXing.

DXing is more than a sport it is a passion. There are few things in life as exciting as working a new one especially if there is a huge pileup. This may sound as if I have a very shallow existence but as I said DXing is a passion and if we are not passionate about something then our existence is shallow.

I'm not on the DXCC Honor Role yet, but I'm working on it all the time. That does not mean I'm on the radio all the time and with an XYL, two children (4 and 1 yrs old), a house and work I'm lucky to get on the radio at all. However, when I do get a chance to get on the radio I try to make the most of it. Now what does that mean. It means I use the skills that I've developed over the years to the best of my ability. The most important skill that I have (and most hams just do not seem to get the message) is to LISTEN. When I come across a pileup the first thing I do is find the DX station and get his call. I then see if he's working split and then try and find the station that the DX station is working. I zero beat and then and only then am I ready to make a call. If the DX op is good it will only take me a few calls to work him and about 80% of the DX op are good.

At this point you probably thinking Sure anyone can work them with a kW and monobander up 200 feet with just a few calls. I wish that was a description of my station. My rig is a Drake T4XB and R4B running a 100 Watts and the ant is a Butternut Butterfly Beam on my roof

I have listened to pileups where a station will call every few seconds I wonder when do they listen. A lot of hams still do not know how to operate split, how to zero beat or the meaning of listening UP.

This post has gotten a lot longer then I had planned and I would like to make one final point before I end this post. Educate the DX ops before they go on a DXpedition.

>interest than the average ham. But there are other types of non-technical
>stories that could be run. How about tutorials on operating DX or
>contests? When was the last time we had a description of grid squares
>and VHF/UHF weak-signal operating techniques?

Given the limited amount of page space available, is it really a good
idea to revisit material that's in the Operating Manual? Not only is
that information already in print there, but it's covered in far more
detail than QST space would allow. If we have to republish tutorials
on every aspect of ham radio every few years, we'll *never* have room
for new stuff.

>On a semi-technical
>level, how about an article covering receiver/transmitter specifications?
>It would describe what they are and which ones are important when choosing
>a radio to buy.

Yeah, this is needed. It should have been done for "The Radio Buyer's
Sourcebook." The problem with putting this kind of thing in QST is
that three years later, the newbies can't easily get their hands on it
and those who read it originally can't remember where or when it was
published. (And QST indexing is less than outstanding.)

>We've had plenty of "introduction to packet radio" type articles, so we
>probably don't need another that covers how to CONNECT through your TNC.
>But how about the next level up: An article covering NET/ROM, TCP/IP,
>ROSE, the future of high-speed data links, etc (in moderate technical
>detail) would be interesting.

Stan Horzepa has provided overview-level coverage of most of this
in his packet column. But I wouldn't mind seeing a well-written article
that does a side-by-side comparison of the networking capabilities
of NET/ROM, ROSE, TEXNET and TCP/IP. Anyone care to write one? (Note:
this is *not* a promise to publish it if you write it! I'm not on the

QST editorial staff, and in any case, an article has to be evaluated before it can be accepted.)

I used to think that the QST technical level should be considerably higher than it is. To a degree, I've become convinced otherwise. The vast majority of hams are not engineers and cannot be expected to understand highly technical material. They are tinkerers, to the extent that they are technically active at all, and want tinkerer-level material. But I do think that there should be room for the ground-breaking technical stuff, if for no other reason than to provide visibility to such work. And QST should publish overview articles that contain enough detail to let the technically inclined know whether they want to delve deeper.

Of course, there is very much a place for highly technical material in Amateur Radio. Outlets for such material include the various conference proceedings (Central States VHF, Microwave Update and ARRL Computer Networking conferences and the AMSAT Annual Symposium). Another place is QEX. I know that many disparage QEX for its thinness and its content. One reason I recently agreed to take over the editorship of QEX is to work on those problems. While the thinness problem can't be fixed overnight (we can afford to lose only so much money on the thing), I hope to bump up the quality.

But in the end, both QST and QEX quality depend on what we can get folks to write for us. I urge all of you to consider what *you* might write. In the case of QEX, there is no restriction on the technical level of the material. (Of course, it does have to be germane to ham radio or radio in general, but "germane" is pretty loosely defined!)

One new thing we are doing for the first time in September is publishing companion articles in QST and QEX. We have an article on a neat DSP audio filter box (no, not just another tunable CW filter). The QST article gives some fairly low-level technical explanation but concentrates, as QST articles do, on building and using the thing. The QEX article explains the algorithms used and shows the results of a number of computer simulations of the algorithm. Depending on how well this is received, perhaps we can do more of this sort of thing in the future.

Your input on QST and QEX directions is certainly appreciated; your submitted manuscripts would be even more useful.

1769. UHF antenna switch.

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-05 18:01:41 UTC
From: andyw@aspen32.cray.com
Message-ID: <1992Aug5.130141.25419@hemlock.cray.com>
Source record: 286252

I'm looking for advice on antenna T/R swiches. I've checked my
copies of the RSGB VHF/UHF manual & the ARRL manual, and they
were some use, but not a lot.

The transmitter puts out approximately 20W, and the receiver
may have a GAsFET front end (don't know whether I'll need it yet).

A design that I've used in the past (thanks Chris!), consists
of a 1/4 wave with a PIN diode at each end :-

```
antenna The diodes are PIN diodes,
| R is chosen for a current of
| 50-100mA, and may have a
--- RFC in series. The caps are
--- silver mica.
| ______________
tx --||--+-|>|------+---()______________)----+---||--- rx
| 1/4 wave |
> -
> R V
> -
> |
| |
+12 V when transmitting gnd
```

This seems to work well, but the resistor seems to dissipate a lot
of heat (in fact, the whole thing dissipates a lot of heat!).

The ARRL book describes an alternative setup :-

```
antenna
|
| Once again, the diodes are PIN diodes.
---
---
|
tx --||--+-|>|-----+-----|<|-+--||-- rx
| | |
> $ >
> R $ RFC > R
> $ >
| | |
+12 on tx gnd +12 on rx
```

I've never built one of these, do they work well ? It should
work if I reversed the diodes & swapped the +12 & gnd (so that

I gounded one of the resistors on tx and the other on rx - I
could use power N-cannel FETs then).

Does anyone have a different design they consider better than
either of these ? I've heard of some integrated PIN diode switches,
where can I get them in small quantities ? Will they handle 20W @ 430 ?

I don't have anything against mechanical relays, except this is
intended for a packet setup, so the noise might become a little
bothersome, moving parts are OK, as long as they're fast
and reliable..

Ideas, anyone ?

Well, that's putting a bit of a spin on it. What was said was that
we hadn't head of any specific action with regard to compressed
files. There is a rule against encryption *for the purpose of obscuring
the meaning* of the data. To that extent, there has been a ruling
precluding encrypted data. There is also a rule that disallows HF
transmissions that aren't ASCII, ITA2 or CCIR 476/625 coded. (I don't
mean to be pedantic, just specific.) Which is not to say that some FCC
field staff member might not have said, "sure, go ahead and send that
data..." But field staff don't make policy, so caveat emptor.

Kenwood TH-77A dual band HT radio

* full mods already done (RX 118-174 including aircraft, RX 400-512, RX 800-950 TX 136-174, TX 400-512)
* a few months old
* includes case, BC-11 rapid charger, BP-6 battery, service & owner's manuals.
* mod notes included

All for $385

Kenwood TH-77 dual band radio (Asian model)

* full recieve mods done (RX 118-174 including aircraft, RX 400-512, RX 300-400, RX 800-950)
* TX only on Asian/European amateur bands 144-146 and 430-440.
* have Japanese & English language manuals (text on case of unit is in English)
* about 9 months old
* BP-6 battery included, original Japanese box etc. (impress your friends!)
* mod notes included

This radio cannot be modified to transmit on US frequencies. The Japanese gov't cracked down on out of band mods in their own country and made the manufactuers put transmit locks in the CPUs. Kenwood Tokyo says I'm out of luck as far as converting it and Kenwood USA says 'maybe' you could replace all the necessary parts including the CPU to make it work in US bands.

I'll throw in the service manual Kenwood gave me if you want to try to figure out a mod. Maybe someone in Japan, Canada or Europe wouldn't mind the radio the way it is since it should work in their band plan. Nice HT receiver in any case.

$285

The TH-77 is a pretty nice radio. It's small for a dual bander, has a lighted keypad, nice sturdy metal case etc. (unlike the TH-78A I just bought which has a plastic case).

I echo Zack's sentiments exactly. I worked some outstanding DX on 10
meters at the bottom of the last cycle--while only running 100 watts
to a dipole. As Zack correctly points out, the opportunities are not
as frequent as during a solar maximum, but they ARE there. It's just
a matter of watching for them. Does 10 meter activity decline at the
bottom of the cycle? Yep. Is the band utterly dead? Not by a long shot!

Morse code:
system of dots, dashes, and spaces, or of visual or aural repre-
sentations of them, used in telegraphy and in visual signaling to
represent the letters of the alphabet, numerals, etc. named after
Samuel F. B. Morse.

Morris chair:
large arm chair with heavy cushions and an adjustable back named
after an English poet and craftsman, William Morris.

Morris dance:
English pastoral dance in four-four measure in which the partici-
pants are costumed, carry tambourines, and wear ankle bells.

Morris minor:
a four wheeled death trap sometimes refered to as an automobile.

Then of course, Morris the Cat who hawks ground horse meat for felines. And
the Morris Foundation who tries to prevent old horses from becoming pet food.
Finally I also saw a referance to Morris Code being something in the Law. I
hope that this clarifies what all these many Morris's are. Too bad that the
people who need this information the most have established a kill filter and
will never get it. (Perhaps they wouldn't get it anyways...)

Amateurs have a reputation among themselves for ruining the pronunciation of
things. Yaesu becomes Yahoo, Heathkit becomes Griefkit and so forth. How is
it that by refering to Morse Code as Morris so many clocks got over-wound?

I picked one up last weekend. The passband filter is astonishing with SSB. I have been very impressed when using the passband filter with the notch filter and the traditional AF gain at full while using RF gain as a volume control. It can lift out a tiny SSB human voice out of a wall of crashing atmospheric noise like nothing I've ever heard.

It's nice to have a radio with knobs that make a difference.

1779. Propagation Questions; planning scheds

Having been a hardware guy for years, I never was much of an operator. One aspect of ham radio I never learned much about was propagation. Now I've moved to Portland from the San Francisco Bay Area and would like to have a regular schedule with my old friends. The questions:

1) How do I select a good freq/time to cover this range?

2) Is my antenna radiation angle critical in this? (I have a rather low dipole that is oriented about N-S)

Thanks in advance,

My point is that the (3) technical explanation is often inadequate.

And I bet that even you have read a lot more construction articles
than you have actually built, right? If you're not going to build it,
then the detailed construction information is less interesting than
a more general explanation of how the unit works and what were the
factors influencing the design.

Sponsor: Platinum Coast Amateur Radio Society
Date: Saturday September 12 and Sunday September 13
Time: opens 9 AM both days
(6 PM Friday set up for swap tables/dealers/tailgaters)
Cost: $4.00 per person advanced/$5.00 per person day of show (both days!)
Location: Melbourne Auditorium and Rialto Place Hilton
Talk in on 146.25/.85 - see also directions below.

Features;
hourly prizes plus grand prize
dealers/commerical vendors of things electronic.
swap tables (inside air conditioned Auditorium)
are available for $10/one day, $15/two days (about gone!)
free outdoor tailgating area for non-commercials - no reservations

forums, meetings, breakfasts and lunches at Rialto Hilton
(transporation provided between hotel and auditorium)
free parking at Auditorium and Hotel
QLF contest on Saturday.

Unofficially Unsupported Feature:

The Space Coast Amateur Technical Group Unbanquet at Ryan's
Family Steak House just about 1 block south of University
on Babcock St. (SR 507) starting approximately 7 PM until
they throw us out or we want to leave.

Listen to 147.54 simplex for others enroute.

Directions:

to auditorium:

I-95 to US-192 exit. East to Babcock St. North 2 stoplights to
Hibiscus Blvd. East to auditorium (on right hand side).

to hotel:

I-95 to US-192 exit. East to Babcock St. North 3 stoplights then
look for Long John Silver's Seafood and Wendy's Hamburgers on west
(left) side. Entrance to Hilton Rialto is between these two
businesses (don't worry - it's the 2nd tallest building in town and
is next to the taller Sun Bank building). Mention Hamfest to get
special rate.

Message-ID: <".5-Aug-92.16:12:07.EDT".*.Wayne_A_Lightsey.Roch809_XBS@Xerox.com>
Source record: 286257

Bob,
I have one of the SGC tuners (sells for about $550 @ AEX) in use mobile and trying different antennas. The tuner seems fine and operates as advertised. However, you are not going to get much signal transmitted with a 96 or 108" whip on 75 meters!

#1 problem: I am using a Kenwood TS-430S which is VERY sensitive on the SWR auto-shutdown feature. The SGC tuner only guarantees to achieve a match of 2:1 or better. Mostly it is better but my TS-430 was still too sensitive; so I had to "de-sensitize" the SWR detector/shutdown circuit to tolerate the SGC tuner - particularly while it is tuning.

#2 problem: the antenna. SGC sells a helically wound antenna with ratchet type mount for mobile purposes at a ridiculous price (I think it is in the $800 range for the antenna and mount!). I have used the tuner with a random length of wire (40-50 feet) hoisted up into a tree and it works real well on all bands. The short mobile whip does fine on 20 meters and down but just doesn't have enuf exposure on 40 and up to hack it efficiently. I am about to try my own helical on a 108" fiberglass rod and use a Radio Shack ratchet mount ($14.95), etc. to see how well that will work. I have tried a longer whip (14 feet) but it tends to flay the power and telephone lines overlying the roads, creates great noise, attracts too much attention.

Comment: It is probably the Kenwood TS-430, but I find that SSB voice on a new grequency can take considerable longer than the stated spec to "tune" in. I find that setting the rig to CW mode and reducing power to about 10-15 watts out for the first time on a new frequency / antenna, the tuner locks right in. Subsequent returns to the same frequency (within the range of tuner memories, 99) regardless of mode, locks right in as advertised due to the memory.

It is a somewhat expensive tuner but is fully automatic, rugged (comes with an ABS watertight case for boat mounting or on exterior of car!) and thus far durable. Its price is comparable to that of ICOM and Kenwood tuners that tune based upon digital control from the transceiver and only cover 80-10 meters. The SGC gives me auto tuner for ANY transceiver from 160 meters and up. I think it is a useful and prudent investment if you are looking for an autotuner. 73,

Wayne KB6CSP

Gee, someone who remembers the "Carl and Jerry" days in Pop-Tronics. It was some hand-me-down copies which got me interested in electronics and hamming, and I remember learning the code by transcribing some articles into Morse (gaack!). I wonder if my old collection is sitting at home somewhere...

Remember the story in which Carl and Jerry changed the capacitance/foot of some coax by heating the inner conductor with a high current transformer and then pulling out the inner wire (with a thinner wire soldered to the end for insertion) when the dielectric softened? I think they needed it for some kind of burglar alarm (they were always building burglar alarms). Talk about scrounging parts. I wonder what Carl and Jerry are doing today, given that they are about retirement age :-)

>pile-up over a split operation ANY time.
>
>73 de Jerry, K1MER

Some of us who work the other end--i.e., DXpeditioners--switch to split
when it becomes clear that the pileup can't hear our responses on the
same frequency. Usually this happens only when it's a BIG pileup.
In such cases, if we didn't use split the QSO rate would drop drastically,
and everyone would suffer.

1788. Re: FT-470 Intermods?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-05 23:53:02 UTC
From: summers@hpspkla.spk.hp.com
Message-ID: <30690011@hpspkla.spk.hp.com>
Source record: 286269

I looked at my u2AT schematic last night, and it turns out that it uses a varactor tuned front end filter. Thus it is able to knock out a lot of out of band signals which might other wise cause intermod problems, while still maintaining a wideband receive capability. The tune voltage for the varactors is developed from the VCO tune line.

There is a difference between intermod and spurious. Intermods are developed when two out of channel signals mix to produce an in channel response. Third order intermod occurs when the second harmonic of one of these signals mixes with the other to produce an in channel response. For example say there are two repeaters on 146.88 and 146.82. These two frequencies will develop 3rd order products at 146.76 and 146.94. Tuning the receiver to either of these frequencies you would hear both conversations at the same time (assuming their signal levels were high enough to cause the intermod). When I have discussed intermod previously, it is the third order products that I have been referring to.

A spurious response results when a single input signal, at a frequency other than the desired receive frequency, mixes with the first LO to produce an output at the first IF. For instance suppose that I am tuned to 145.21 MHz and my first IF is at 21.7 MHz (as is the case in the 470). My first LO is 21.7 MHz above 145.21 MHz or at 166.91 MHz. A signal at 156.06 MHz will generate a spurious response at 21.7 MHz since 2*166.91-2*156.06=21.7 . Thus the second harmonic of the LO mixing with the second harmonic of the spur frequency ends up in the IF. Just how susceptable the receiver is to this spur product depends upon the design of the first mixer and the gain and linearity of the preamplifer, as well as the ability of the input filter to reject 156.06 MHz. Since the VHF front end is fairly broad, the filter will do little good.

I suspect the IF frequency change in the 470 occured as a result of spurious problems, since the IF frequency should not affect the intermod dynamic range. In fact, another ham in the area brought his 470 over and we checked it for its intermod performance and it was identical to mine, however his had the original 17.3 MHz VHF IF. Thus I guess my performance is typical. From email I have received since my original posting, it appears that this type of performance is typical for dual band radios made by all of the major manufacturers.

After using the Hustlers, the Ten-Tec 75m whip, and the Spyder....
The best is by far the Spyder!!! It's top loaded, for best efficiency
on whatever band it's used on. It's the easiest to tune, too.

I've had them on vehicles and the roof for years, and Spyders are the best.

Tom WB9RXJ

1791. ARRL Name

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 00:34:56 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9208060035.AA18590@cmr.ncsl.nist.gov>

A recent poster mentioned that the Hudson Div director says that feeling is running 60% in favor of changing to AARL. It seems to me that I've heard that the push for the new name COMES FROM THE HUDSON DIV DIRECTOR, or at least from his cronies. You might want to check this out.

ON THE OTHER HAND ....

Monitoring our News Group leads me to feel that the ARRL ought to change its name to Association of Rabid Radio Lawyers (ARRL), to fit our type of forum.

Q. What types of pizza may I order through amateur radio?
A. License classes below General may only order cheese topping, and no Jumbo pizzas. On the other hand Extras may order anchovies "and the works".

Q. If I come upon an injured pedestrian, may I call for help by amateur radio?
A. It is very important to determine the cause of the injury. Only people struck by BMWs and Mercedes may be aided on weekends.

Q. In the case of a multicar accident, may I call for help?
A. Since the emergency response services are tax-supported, it is very important to first determine the proportion of domestic content of the vehicles involved. Please note than some "American" nameplates are really imported cars, while some Hondas have more than 50% US content. Add up the US content of the vehicles involved in the accident. If it is over 75%, you may make an Autopatch 911 call; if over 50% you may use the Autopatch but must call an intermediary who will call for help; if below 50% you must walk to the nearest pay telephone. See, it's all very simple.

Q. May I play music on my ham station?
A. Of course! However you must operate between 88 and 108 MHz and transmit your call letters at least every 10 minutes. Minimum power allowed is 100 watts. Please keep us up-to-date on the audience response.

I should suppose that these items will cause a suitable response from Julian MacCrusty, famous Morris operator. (That's a joke, son.)

73, Bob W3OTC

Opinions? How could these be other than hard, cold facts?

1793. Amateur Radio Courses On Computer

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 00:52:58 UTC
From: jkearman@arrl.org
Message-ID: <372@arrl.org>
Source record: 286227

Anyone know of any real computer-based Amateur
Radio courses? I know there are some
rudimentary ones that merely ask questions
and tell you if the answer you gave is
correct. Are there any that actually teach
the material?

Would you have used such a course, had it
been available?

Do you favor the strictly 'memorize the
answers' approach, or the 'learn the
material' approach? (Bet I know how this one
will go.)

If you've used a computer-based course of any
kind, I'd appreciate knowing your opinions.
E-mail to jkearman@arrl.org is okay. I'll be
on vacation from Aug 6 afternoon through Aug
12, so I might not acknowledge your message
right away. But, I'll look forward to receiving
your suggestions. Thanks and 73.

How about:

ARHL Amateur Radio History League

ARPC Amateur Radio Printing Company

NENARP New England Nerds Against Radio Progress

SPORE Society for the Preservation Of Radio Elitism

AAROFS American Amateur Radio Old Farts Society

AARL Anachronistic Amateur Radio League

Oh yawn...actually, it doesn't matter at all. The ARRLasarus' OF's will never allow the name to be changed - Heavens! Change??!! NO! Kindly remember that the anti-no code people are mostly still alive, and still in charge and the FCC *still* takes it's marching orders from this glorified Publisher-of-sometimes-dated-full-of-contest-results monthly magazine and outdated books.

I joined the ARRL to try to get some positive changes happening...the basic theory being: If you're not involved you can't change it. Well, the truth is even if you*are* involved you may not be able to change it! When K1ZZ finally wakes up to the situation on 10 meters...then, I'll be impressed. Meanwhile, my membership is paid in full till 1995, and I'm still gonna bombard the 'Nerds-from-Newington' with my letters that ask embarrasing questions! Like:

"When is the League going to insist that the FCC and the 'government-to-the-south' DO SOMETHING about those miserable bootleggers that are wiping out the 28.0-28.175MHz portion of the 10 m band?!!!"

Would just one of you guys at HQ ask his honorable K1ZZ that question? PLEASE!

>
Jim-see my previous posting about the lack of response from HQ regarding
10 meters. Also, I'd like to say that the balance of general-interest vs.
technical articles is IMHO a bit light on the technical side, but then you
gotta have something to publish in QEX right? ;-) Here's the other side of
the ticket: Why not publish a seperate monthly with all that stupid, boring
contest stuff in it? You could call it..uhmm..."QRZ?"..yeah..and make the
contest people pay an extra $24/yr just like the readers of QEX...yeah!

Is there a chance in hell?? You tell me...

>of a 1/4 wave with a PIN diode at each end ...

>This seems to work well, but the resistor seems to dissipate a lot
>of heat (in fact, the whole thing dissipates a lot of heat!).

>The ARRL book describes an alternative setup [similar, but without
the 1/4-wave transmission line]

I bet the 1/4-wave design has better receiver isolation.

>Does anyone have a different design they consider better than
>either of these ?

I have successfully used reed relays at 450 MHz. The ones with 500-ohm, 5V coils can be driven directly from a TTL gate. They switch in a millisecond or two and can handle 20 watts with ease. Acoustical noise is barely audible. They do have some stray inductance and capacitance which should be tuned out for best results.

Yes, you can use the same amateur 2M band as you do in the US. Just remember to sign your call followed by the prefix of the province you are visiting. For example if your call was W6ABC and you were visiting here in British Columbia you would give your call as W6ABC \VE7. I hope you enjoy your visit to Canada. A copy of the ARRL Repeater Listing will give you the repeaters up here as well. 73 es welcome to the Great White North Eh!

1800. SOURCE OF HAM FILES AND RIGMODS

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 02:51:06 UTC
From: lairdpg@lub001.lamar.edu
Message-ID: <1992Aug6.195106.1406@lub001.lamar.edu>
Source record: 286105

A nice collection of HAM related programs, text files and rigmods can be found on the HAM Connection BBS Line. At present, the system is running on a 386 system with 2400 Baud. Plans to expand to a 38,400 shortly. System takes about 4-5 minutes at the most to register and you have no upload ratios to maintain. Just take what you need. Since this is an experimental system, its continuation will only result if it is used. This is dedicated to the many amateurs who enjoy computer BBSing and information exchange.

The data line number is : (409)833-1795 and the system supports ansi, vt100 and ascii graphics. It is online 24 hours/7 days per week.

This notice was posted for informational purposes only to tell you where you might find HAM related files, etc.

1801. Re: DXpeditions Working By Call Areas

>I disagree that DXpeditions should be "fair" to
>all. If your station isn't competitive, don't
>expect to break pileups as if it was. Work on
>your operating skills and save your money for
>a better antenna system.

There's a vast difference between "leveling the playing
field" and being fair.

When I'm operating off a mobile multiband vertical mounted
on my car in the driveway (HAAT 8 feet :-)) with coax run
into the house to my radio, or--perish the thought--off a
porch awning, I certainly don't expect DXpeditions to adjust
their operations so that I have an equal chance of getting
through as someone using a monobander at 100 feet and
an amplifier. But I *do* expect them to operate in a
way that enables operating skill on my part to occasionally
win out over other callers' brute strength. That's fairness.

Patty

p.s. I've got plenty enough money for a better antenna system.
I just don't have enough to buy a house anywhere in this area
where I could put one up...

Message-ID: <1992Aug6.045940.18978@freyr.uucp>
Source record: 286186

Mode K on RS-12/13 is very easy to use... I have been working my father
in Mississippi using a multiband dipole mounted in the attic and a TS-440/AT
with no problem... it is good for about a 5 - 8 minute conversation. I
use Orbit 3.9 on my UNIX box for keeping track of RS-12/13... BTW it is
listed under its payload name of Cosmos 2123 in Kelso's NASA listings.

Thanks for the backup. Some asshole got on the radio the other night while I was with my friend using 2m and he just reamed me as I was talking to some other ham about just passing my exam. I think his callsign was W4AD, but I couldn't find it in the callbook. Anyway, if anyone works N3HQJ (he identified himself as High Quality Junk!), tell him that I said I was sorry about that idiot. Some way to celebrate the day I passed my exam!

>QST articles. I was asked to write a series of fictional pieces
>that would explain operating practices. The theory here is,
>fictional pieces go down easier than tutorials.

Ah! One of my "pet peeves". Sloppy operating practices. When I
was a young amateur and keen not be be thought of in bad light - yes, I
don't worry any more - I worked hard on getting my R/T proceedure
right. The ARRL had an excellent book called something like "The
Operating Manual". Can't find it right now, maybe my ex-wife has it.

It taught me haw to call CQ, how to ID etc. I bothered to
learn ICAO/NATO/CCITT phonetics etc. Funny they don't test for
phoentics, just Morris. God how I hate homebrew phonetics, try and
figure out "Honolulu" for "Hotel" with an S1 signal. This book, which
seems to be out of print, even had a full listing of the Q codes. Yes,
I will personally dismember the next idiot that says "QRZ the
frequency".

Good proceedure makes for snappy exchanges for contests etc,
good ID of other stations and removes confusion as to who's turn it is
to latch the PTT. There are no visual clues in radio and it is damn
hard to interrupt, so we depend on good proceedure to communicate.

Funny how radio amateurs, in a hobby of communication, can be
such damn poor communicators.

Personally, I would like to see proceedure in the exams. Then
it would be taught.

As I reach the end here I wonder who started the moronic "Well
I'm destinated". Maybe it is just proof that amateurs are guided by a
highjer authority. The FCC?

So, how about a new book just on "Operating Proceedures".
Voice, Morris and maybe even text modes.

Source record: 286185

The following was posted as a favor to Joe, KH6GDR:

--------------------KH6GDR writes: ----------------------------
After reading tons of input on DX operating here on INTERNET, I
just have to ask a friend to put in a lick for me. I surely don't
know the RIGHT way to work DX, but I can relate my own experiences.
I've had the wonderful opportunity to be in a few places (where
my work carried me) and operate with several DX calls. I tried
being courteous and that didn't work at all. I tried to work
occasionally by districts and that almost drove me crazy. You can
BET that when you call for 3s there will be a plethora of 4s, 5s
and 6s answer. You can ask for Kansas and bet that Minnesota and
Oregon will come blasting back. I have been on the stateside part
of split operations that obliterated half the band. I must tell
all of you that I finally worked on a single frequency, day after
day and at about the same time since my work schedules dictated
operating time. I grabbed 6 or 8 calls out of the loudest (and
sometimes the most infuriating) and worked them, calling QRZ when
I was ready for more incoming. I ALWAYS repeated my call and the
other station's (to keep it legal). I gave fairly accurate
reports. I repeated the QSL info about every 10th contact. DXers
caught on to my habits quickly. And when "they" got uncontrollable
- I warned everybody twice and then SHUT DOWN ! After doing that
several times, things got better. Now I'm too broken and stove in
to do it again, but it sure was fun.

1808. Meteor scatter?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 12:27:39 UTC
From: mleech@bnr.ca
Message-ID: <1992Aug6.122739.4060@bwdls61.bnr.ca>
Source record: 286187

Twice in the last week, I've been calling CQ towards the southeast from FN-25, and twice stations from New England have come back to me. The paths lastest just barely long enough to exchange reports; much less than minute. This leads me to suspect meteor scatter. These contacts were between 02:00 and 03:00 UTC (K1??? and W1MCF).

My setup is: IC-271 driving a Mirage B108G (80W + GaAsFET), feeding 2x7el with 1/2" Heliax. My antennae were pointed southeast at the time.

The possibility that these were meteor contacts has awakened in me a desire to DELIBERATELY try operating meteor scatter.

Since the Perseids are coming up, I'm looking for skeds. I'm a complete novice at meteor, so I need direction with regard to operating practice, suitable beam headings, etc, etc. Proposals via e-mail. I'd like to try some evenings this weekend, and during the Perseid peak next week.

Help!

Mine still transmits fine, but has quit receiving... The squelch still works fine, and I still get white noise out of the speaker when the squelch is broken (although it has a slightly different character - this would be REALLY hard to describe...) Everything on the radio appears normal.

To the best of my knowledge, there were no "significant events" associated with the loss of receive capability...

Has anyone experienced this problem? Is it worth pursuing? What was the fix?

1812. Yaesu FT-101 Mods for 10MHz (30 meters) Wanted.

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 13:26:54 UTC
From: rabassa_ao%ncsd.dnet@gte.COM
Message-ID: <9208061325.AA21746@bunny.gte.com>
Source record: 286192

The Yaesu FT-101 HF radio has a band selector position for WWV/WWVH.
This position is used to receive WWV/WWVH transmissions, and to
zero-beat the internal calibrator. When transmitting into a dummy
load, I measure approx 2 watts of TX power in this position.
To me, this suggests that the majority of the transmit chain exists.
I began looking for a hidden "trap" in the low power section of the
rig to see how Yaesu killed the 10 MHz TX capability. I could not
find one! Infact, all of the wafer positions on the band selector
switch contain proper components for TX.....except one.....

The last wafer (inside the RF tank) has no tap to the pi output
network at the WWV position. It appears (to the casual observer)
that adding a wire from the last wafer to the midpoint between 7
and 14 MHz pi tap-points will complete the 10 MHz TX chain.

Does anyone have any other information on this MOD??? Was there
a Fox Tango publication on this modification? Are they still
in business?

Thanks in advance.

Keep us posted on your progress. There are a lot of us with 470s and
many of us wouldn't mind modifying them for increased intermod rejection
if it can be done without sacrificing performance.

>The Yaesu service department was anxious to help me once I got through to
>them, and they faxed a copy of several pages from the service manual to show
>me how to take the radio apart to do the "fix" mentioned above. They seemed
>very "customer conscious" which was refreshing.

Indeed! My dealings with Yaesu have been uniformly satisfactory. Of
course my dealings with Icom's Atlanta service depot have also been
highly satisfactory, though Icom America's national office could take
some lessons from their Atlanta people. The only major manufacturer
who has been a pain in the rear has been Kenwood, bad rigs, bad service,
bad attitude. I really like Alinco, but their national parts and service
system is very immature. With people like Jay helping them, they may
get there fairly soon though. I like to see the little guys prosper.

>The 24AT does not receive both bands at the same time. The ICOM W2A
>does (you didn't list it).

The TH-78A will not only receive both bands at the same time, but it can also receive two VHF stations simultaneously or two UHF stations. It's the only radio in the list that does this, and the main reason why I bought it. Works great.

>Both the W2A are [sic] smaller than the Yaesu
>(not by much) and much smaller than the TH78A.

Huh? The TH-78A is tiny! Certainly much smaller than either the IC-W2A and the FT-470. Here are some dimensions, courtesy of the HRO catalog:

TH-78A 5.3x1.9x1.6 in (HxWxD)
IC-24AT 5.4x2.0x1.4 in
IC-W2A 6.7x2.1x1.4 in
FT-470 6.5x2.3x1.3 in
DJ-580T not listed (similar to TH-78A I believe)

I think these values are for the battery pack which comes delivered with the radio. Here the TH-78A has the advantage that it comes with a 700 mAh 7.2V NiCd which is housed *internally* (slides into the chassis).

Also want to point out that Yaesu has a new dual band HT. I am not sure if it's available yet, but it's worth checking into.

Almost all of it is covered in the Conference Proceedings. Anyone seriously interested in packet should own the entire set. That doesn't mean that update articles in QST wouldn't be appreciated, however. The field is still rapidly changing.

>A second suggestion would be to take the recent article on Mixers for

Excellent suggestion. Most of this is in the Handbook, but not in step by step form. It would be a hard series to write well, however. DeMaw's solid state design book is currently the most accessable source of this information.

You could always do what i did; mount a small magnet on some solid surface
and forget about having to hook the metal piece of the mic. onto the holder;
just wave it past and let those little lines of magnetic force do the rest.

Since this country is founded on a two party principle, maybe Amateur
Radio should have the same. A new organization with the interests of
forward thinking, progressive amateurs. Call it the:

Progressive Amateur Communications Society. (PACS)

But then, you could be accused of giving PAC money to the FCC. :-)

Sometimes I get frustrated with Newington. i really laugh sometimes at
the "Dad works all day and comes home to read the paper and smoke a
pipe, while mom is slaving to make dinner and the kids are model 1956
style well behaved with no problems" genre. You can turn to reruns of
father knows best on cable for that.

But sometimes the league shows a ray of hope. THen sometimes it shows the
conservative roots. Alot of my friends from the 1970's who were hams never
stayed active, because of the lack of progressivness.

The hobby offers alot to everyone. Whether your an Am'er still using 807's,
a nice shiney new Kenwood operator, or a computer nut using packet, it's
for everyone. THe respresenting organization must represent all facets
including needed changes. (Yes, NTS comes to mind).

Jeff
Pro choice on code
pro choice on Am
pro choice on slopbucket (ssb)
pro choice on Fm
pro choice on packet/amtor/rtty

Andy,
The integrated PIN switches I have used are of the quarter wave (or lumped equivalent) variety. Mitsubishi (at least) makes versions for 144,430,900 and 1200 MHz which handle a good deal more than 25 watts with no problem.
I've obtained the ones I've used directly from Tokyo but I've talked to RF Parts (San Marcos,CA, and advertising in all the usual places) and they always claim "we can get them". To date I haven't been able to get them to produce any. The more phone calls asking for them the better the chances I would think.
Receiver isolation is usually on the order of -35 dB and transmit insertion loss is under 1 dB even at 1200 MHz. They make lower power versions for at least some of the bands, HT and similar applications I suppose. Look for part numbers of the form MD-00X, with X = 1,3,4,7.
They do run about 50 mA during transmit but that doesn't seem to big a deal since the PA is no doubt running a lot more than that. Turn around time is microsecond or sub-microsecond territory. My entire 900 MHz radios turn in less than 10 microseconds except for the receiver detector stages which take another 30 or so after being saturated.
I have no connection with Mitsubishi and their PIN switches except that they have been the only kind I could get. Your mileage may vary etc.

I'd appreciate it if somebody out there with a tube manual that
shows base diagrams would look up the 3B28 for me. (Not too many
tube manuals laying around here at Motorola :-)

Wayne,
I don't have a tube manual handy but I do remember the day I got my
hands on some 3B28's and was able to get rid of some 866's. As I
remember the the 3B28's are pin and function compatable but don't have
liquid mercury sloshing around on their insides. Instead they are
gaseous (Xenon?, heck if I know) and also don't require vertical
mounting as do the 866's.
As long as the HV supply seems to be working, I think you could consider
yourself fortunate to get them.
But then, it's been a long time, what do I know.....?

The 3B28 has the same base diagram as the 866. If I remember
correctly, the 28 has a lower current rating than the 866
because of the type of "gas" used. K9ALD

>
>Steve, AA6LF

HEAR, HEAR!! I'll *take* split operation almost ANY time! Even if it's only 1 kHz, it makes an *enormous* difference to all parties. Last night is a good example: FM4-something was on 14003 about 0300Z. We're not talking rare here, but it is one of the tougher Caribbean islands. He was a so-so operator (Dan, apparently from France). But he was taking all calls on his freq. The pile got deeper and deeper as he was posted on more and more packetclusters around the country. And it got to the point that it was taking him a good minute to get a single call. After a few tries like that, he just went away. Didn't say 73 or nuttin'.

If he had been listening up even 1 kHz, he would have worked one or two stations per minute, he would have worked 'em until he was tired or, perish the thought, until he had worked everyone in the pileup!

I think what Jerry is reacting to is the DXpeditions that say "listening 14200 to 14250," and yes, that does seem extreme and causes a lot of non-DXers to get pi**ed off. But in general I think split operation is *much* better for DX stations if there's more than a dozen or so folks in the pileup.

>whip on 75 meters!
The capture area of an antenna compared to wavelength is very
important in terms of results despite what "minimized" antenna
folks say.

Going to a helical antenna will put more wire "in the field" and
to some extent move some of the inductance out or the shielded
box into the air. However, you will have more losses with the
smaller wire on the helical. I doubt that you will gain much
noticable increase. Getting more antenna current outside the box
will help. I would be interested in the results. K9ALD
>Comment: It is probably the Kenwood TS-430, but I find that SSB voice on a new
>grequency can take considerable longer than the stated spec to "tune" in. I
>find that setting the rig to CW mode and reducing power to about 10-15 watts
>out for the first time on a new frequency / antenna, the tuner locks right in.
>Subsequent returns to the same frequency (within the range of tuner memories,
>99) regardless of mode, locks right in as advertised due to the memory.

The continuous tone allows the electronics to react much faster
to a stable signal then the "sampled" and often missing signal
from SSB.

Now, when is somebody going to come out with a remote, automatic
OR manual antenna tuner for BALANCED (wire) antenna that I can
hang up outside and get the RF out of the shack. K9ALD

I saw an interesting program last night on PBS called

Empire of the Radio

It covers the beginning of radio, and inventors Marconi,
Armstrong, Sarnov, and De Forest. Very interesting.
Talks about the spade receiver (right on!), regenerative,
and superhet.

DID YOU KNOW:

Originally (Marconi mode) radio was used only for
point-to-point communications.

One guy thought that since these Electromagnetic
Radio Waves went all over the place, you could put
receivers in peoples home, and send out general
purpose stuff to all of them - like opera, and news,
and symphony stuff.

You would be "casting", or "throwing outward" (as in
fishing) to a "broad" area, as opposed to a specific
place. You would be BROADCASTING.

The word "Broadcast" was coined by farmers.

While your needs are for VHF/UHF, it would be interesting to expand
the thread to HF. I am currently using a 20 meter vertical made from
stripped twisted-pair telephone wire with the vertical element run
thru the center of fiberglass tent poles (from an old REI dome tent).
The vertical element can be guyed with three lengths of nylon cord and
tent stakes (since I usually camp above tree line). A similar support
might work for VHF, altho I usually just rely on mountain height and
use a whip or ground plane. Any other ideas out there for good
backpacking antennas, especially HF?

Message-ID: <1992Aug6.165530.25513@cbnewsj.cb.att.com>
Source record: 286215

I built one of the copper cactus j-poles described in 73 back in March.

It seems to be recommended as a repeater antenna, and seems to function well for me, but I have a question ... is it (even a little) directional ? and if so in what direction. (A repeater antenna would normally be omni-directional no ?)

As it is not symmetrical I would imagine it must be at least a little directional but no mention of that is made in 73.

Thanks for any insight you can give ... you will notice I don't have access to the ARRL Antenna book(s)

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email may be sent to the ARRL/VEC at:

bjahnke@arrl.org

or

MCI MAIL ID: 215-5052

You should include your postal address (the slow kind) in case we need to send you non-electronic material in answer to your question.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you will be attending the test session.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

1836. 3B28 replaces 866

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 17:28:32 UTC
From: jkearman@arrl.org
Message-ID: <373@arrl.org>
Source record: 286108

Wayne Cronin, WA5VIF (wmc@phx.mcd.mot.com) writes:

; I just bought a Johnson Valiant in what seemed to be great
; condition, BUT...
;
; The schematic shows 2 866A tubes in the high-voltage rectifier
; circuit. But there are 2 3B28 tubes in the radio! I found a
; tube cross-reference that does not link these two types.

The 3B28 uses xenon gas or something, instead of the mercury found in the 866. Mercury-vapor rectifiers required a warm-up period to allow the mercury to vaporize, and they generated a fair amount of RF noise. Power supplies of the that era had "hash suppressors," which looked like parsitic chokes. They were RF chokes to reduce that hash noise. Of course, the flashing mercury vapor was pretty impressive. The 3B28s glow a little bit, too, as I recall.

I once had a Valiant, which also had 3B28s in it. I never had to worry about the wind blowing it away!

Hi! Is there an online repeater directory for New York (city and upstate),
New Jersey, Pennsylvania or Conn.? If not, does anyone have one on file?
I would appreciate anything on the subject.

Thanks

>In a message of <31 Jul 92>, Jim Kearman wrote to All:
> JK> Newsgroups: rec.radio.amateur.misc
> JK> Well, Dave I'm gonna post here. What do others think about the
> JK> balance of general-interest vs technical articles?

I think the balance is fairly good. I really, really enjoy the articles detailing how ham radio is more than just a hobby (for example, the articles on hams helping in Kuwait, with forest fires, etc.)
I copy them out and put them up on our college club's bulletin board, to let the public know we are more than just a drain of money for 10-15 people who have nothing better to do than talk with people in Zaire.

Of course, the tech articles are good also. I think there does need to be an emphasis on more "approachable" projects, to encourage new hams to actually get down and build something they can finish and say "wow, I did that." The advanced circuit builders already realize that there are already books with more advanced circuits in them.

I am looking for a point-of-contact regarding ham radio activities in the
Atlantic Beach (Southeast Jacksonville, Fl) area. I have sent letters
to several hams with the 32233 zip code and to hams listed in the
Repeater Directory (South and Southeast areas) without success.

Looking for any additional help or info!!

Thanks in advance, Al NW2M Rockville, MD (301) 294-8621

>
>Greg Lapin KD9AZ
>glapin@nwu.edu
>

While I can't speak for everyone, my experience is that many authors use whatever they have (or can get easily) and use the first circuit that seems to work adequately. Often, they start off with published circuits and try other circuits only when the previously tried circuits don't work adequately. For example, when Radio Shack puts a specialty part on sale, we can normally expect a few articles using it. Of course, these usually get rejected nowdays because by the time we can publish it, the chips are all gone (which is why RS closed out the part).

Of course, there are authors who do optimize their circuits, but these people are in the minority. However, trying to retrace exactly how you got there is often a tenuous exercise at best, particularly considering that many of the better projects really took years to evolve into their final (?) form. Perhaps one should keep in mind that designing is much more of an art than a science. Then again, maybe professional artists do know how they get and develop their ideas ...

So how long DOES it take to signal out Julius Ceaser in Morse?

(I've always thought BBC TV to be kinda boring.....)o

Does anyone know of amateur radio clubs WITHIN AT&T?

Please contact Bernie Malone at the AT&T Shreveport Works with the
name of the club and a contact person and phone number.
Bernie's phone in Shreveport is (318) 459-6924

Please do not contact me. I have no further information.

anyone up for expanding this a bit further, and hitting the more general topic of antennas for restricted space and/or portable use? I've always enjoyed playing around in that area, and would love to see a long, involved thread on it. :-)

In article <1992Aug6.163652.10155@raven.alaska.edu> ffjal@alaska.edu (John Lehman) writes:
>In article <CHARLES.92Aug5212439@greyrock.greyrock.mso.colostate.edu>
>charles@greyrock.mso.colostate.edu (Charles H. Hemstreet IV) writes:
>>I am looking for an antenna that I can take backpacking...

>While your needs are for VHF/UHF, it would be interesting to expand
>the thread to HF.

now it gets fun. :-) (IMHO, of course)

>(since I usually camp above tree line).

I trust this basically means at a level where there aren't any trees? sorry...I grew up in/around the Texas Hill Country....where there are always trees...everywhere......

>might work for VHF, altho I usually just rely on mountain height and
>use a whip or ground plane. Any other ideas out there for good
>backpacking antennas, especially HF?

well, assuming there aren't any trees to suspend a dipole or a vee from, why not try suspending a similar antenna from some other tall structure (even side of mountain)? if you want directivity, use a sloper instead of a plain dipole or vee.

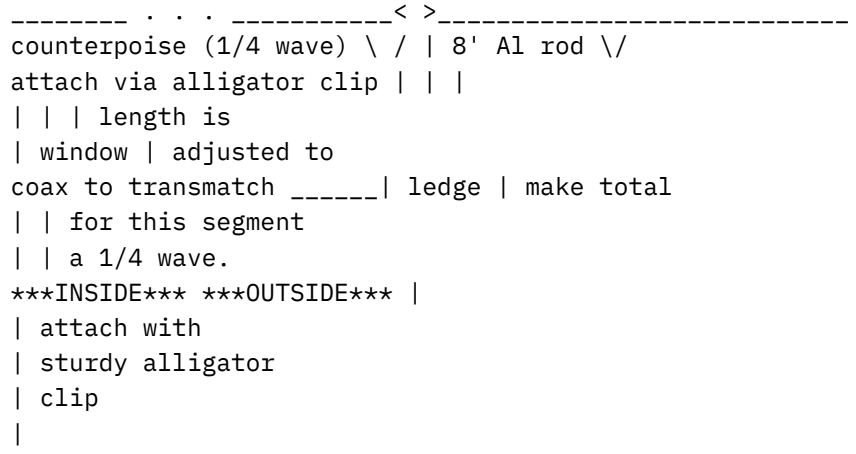
neat thing about a 1/2 wave dipole is
1) easy to transport...just roll it back up and shove in pack
2) lightweight (esp. if you use fairly small wire size)
3) not a compromise-antenna --- you're using a full-size radiator
4) you can set them up just about anywhere, from just about anything, and they work wonderfully.

here's something else you might try, depending on the terrain where you're at....this is similar to my setup at home. it might be tough to make this portable (but then, Hams are supposed to be more creative than the norm, so that shouldn't be a major problem), but it seems to work really well from my apartment.

this kinda assumes that you're on, say, the edge of a cliff, and that it's a fairly steep drop, at least, for a ways.

what you could do is take something sturdy (at my apartment, I use an
8' Al rod, but that isn't too good for portable use) and extend it
horizontally over the edge (out the window at home). at the far end of
this [whatever], you attach a length of wire that is roughly
(1/4 wavelength) - (length of first bit). you let that length of
wire hang freely. generally, the farther you can get it away from the
ledge, the better.

to further clarify what I'm talking about, here's roughly what I've got
setup at home:



counterpoise (1/4 wave) \ / | 8' Al rod \/
attach via alligator clip | | |
| | | length is
| window | adjusted to
coax to transmatch ______| ledge | make total
| | for this segment
| | a 1/4 wave.
INSIDE ***OUTSIDE*** |
| attach with
| sturdy alligator
| clip
|

this installation could probably be adapted for hanging over the cliff
of a mountain. it seems to work out *VERY* nicely on 20m. haven't
tried it much on 40m or 80m, but I will...sooner or later. 20m has
always led me to plenty of AMTOR QSOs, though....

here's hoping this falls into a huge technical thread on antennas.....

/\

SATELLITE PROTON EVENT ALERT

ISSUED: 16:30 UT, 06 AUGUST

/\

Over the last 12 hours, protons at greater than 10 MeV climbed and
passed the event threshold of 10 pfu at 11:45 UT. Protons appear to have
stabilized near the event threshold.

Users of OMEGA navigation signals passing through the polar regions
should be aware of the possibility of errors existing on navigation
frequencies.

HF signals passing through the polar regions are experiencing minor
absorption due to the proton activity, although propagation is still possible
and is expected to continue to be possible. Absorption at the present time
is near 0.6 dB.

1855. MFJ quality?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 22:18:53 UTC
From: endelman@wellworld.Eng.Sun.COM
Message-ID: <l839adINNj3f@exodus.Eng.Sun.COM>
Source record: 286078

I've been wondering about the quality of MFJ equipment. The only MFJ item I own is the 300W transmatch w/dummy load. I've been pretty disappointed at its inability to handle severe mismatches without arcing and melting the capacitor plates, causing a short. After such episodes I've opened the cover and had to take a needle file to the fused plates.

The SWR bridge, antenna switch, and dummy load portions otherwise work fine.

I've been a bit turned off by the hype in their ads, too. It suggests more hat than cattle, as Texans say. (MFJ runs a close second to Antennas West for verbiage/information ratio, IMHO.)

Comments, anyone?

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1857. Re: Ham Radio in Europe

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 22:25:54 UTC
From: IFF118@DJUKFA11.BITNET
Message-ID: <92219.172554IFF118@DJUKFA11.BITNET>
Source record: 286086

That is an answer from European :

Do not care about FCC on you radio !!!!!

As a licensed amateur you can use a microwave owen if
you can assure that it meets the regulations.

US rigs are ok in Europe, 145.999 is upper limit.
What you will need, is 1750 Hz tone to open/activate
repeaters if there's no traffic on them.
They go stby. ca 1 min after last carrer dissapeared.

T
I can provide you with all information on request.

For you, Amricans, that's very easy to complete all
formalities in the countries where US Army is present.

They have very strong communities, thats enough to
call them, and they do all for you.

Feel free for further questions

I suspect there needs to be a "grand unification" of material. Things are too fragmented and detached. somehow this needs to get consolidated again.

Is there "too much of the same thing" coming out of the ARRL pubs dept? (sort of like there's the "Album CD", the CD5 (like the old 45 records), the remix CD (for dance halls), the alternate CDs (artist's cut), the live CD, and best of CD.). Maybe some topics just need the Album CD approach. I should be able to just buy the (i wish it still was The Radio Amateur's) Handbook and be done with it for almost all established amateur radio topics.

I started to sort the league pubs catalog by category. a grand unification would clear the decks of redundant material and probably allow consolidation of some of the similar titles into single publications.

what's happened is there are now pubs going into great detail on small sections of the overall activity in amateur radio (sometimes more than 1). Doesn't it seem logical to consolidate "First Steps in Radio", "W1FB's Help for New Hams", "Now You're Talking", and "Novice Notes"? Gotta be a lot of either the same thing in each or one or two with the Really Good Info and the rest weak or non-existant on a topic. the result should be the definitive "how to get started" book -- a superb reference that can be called on time and time again, not just during the license class or while working on passing the test.

>number of computer simulations of the algorithm.
...
I know this is intended to be a step forward and I appreciate the
effort to upgrade the level of technical information but it still
really upsets me. Why, oh why can't it all be in QST, with the
technical part in a sidebar if really necessary. The people who
can't/won't/don't want to understand it don't have to read it. When I
became interested in ham radio in the 4th grade and found out about
some Novice classes being conducted by some telephone company technical
people who happened to be hams, I started reading QST and the Handbook
from the local public library. At that time, cookbook construction
articles (the simpler the better) were all I wanted and I felt
intimidated by more technical stuff. About the time I reached the 8th
grade, I understood the need to broaden my horizons and started looking
for more technical information (how and why things were done a certain
way, enough information to vary the design for my purposes, etc.).
Now, roughly 30 years later, the world has changed in many ways, not
the least of which is technology. QST is about where it was in 1960
relative to the technical competence of most hams but SERIOUSLY BEHIND
where it was in 1960 relative to the technical competence of the
general public--and I don't really mean math or even formal education
here--just general scientific knowledge about how things work and why.
...
>Your input on QST and QEX directions is certainly appreciated; your
>submitted manuscripts would be even more useful.
...
A very valid point, and I will think about it as should others here.

1861. Re: Alinco DJ-580T Question

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-06 22:47:12 UTC
From: t-dougf@microsoft.com
Message-ID: <1992Aug06.224712.23739@microsoft.com>
Source record: 286102

Recently I've been experiencing problems with mine. It seems that I turn the unit on, and everything seems to work normally, but no signal is received even on the busy frequencies here, for a long time. Then I'll leave it alone for a while (off), and come back, and it'll magically start working.

The unit is broken, obviously. I purchased it late June, so I assume it is still in warranty. It hasn't seen any abuse whatsoever, and as far as mechanicals go, its in perfect condition.

Has anyone experienced similar problems? How would I go about getting a warranty repair?

Thanks,

Doug

1863. Re: Backpacking antenna's???

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 00:24:41 UTC
From: Jim_Sollows@mindlink.bc.ca
Message-ID: <14046@mindlink.bc.ca>
Source record: 286090

Consider making a J-pole antenna out of twin lead. It rolls up real small, weighs nothing and works great...but setting the swr can be finicky. If your interrested in the plans send me an E-Mail message.

1864. Re: Modifications for ICOM handhelds

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 00:27:25 UTC
From: Jim_Sollows@mindlink.bc.ca
Message-ID: <14047@mindlink.bc.ca>
Source record: 286092

With the ICOM ICW2A mod it most definately can recieve the entire range 100MHz to 1.2GHz. The entire mod is done via the keyboard and takes a few seconds, if you're interrested send me an E-Mail message.

1865. Re: Modifications for ICOM handhelds

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 00:37:35 UTC
From: Jim_Sollows@mindlink.bc.ca
Message-ID: <14048@mindlink.bc.ca>
Source record: 286093

AH the truth of the matter is that if you set PL to 100 you can enter and recieve any frequency between 100MHz and 999MHz, then by rotating the tuning dial you can push the radio beyond the 1GHz mark and keyboard enter all the way to 1.2GHz.

Here is the complete Mod....try it for yourself.

Hold Down 3 # B
Turn power on
Hold for 30 seconds
Enter Set Mode
Use ^/Scan key to select PL
Use tuning dial to change the PL Setting as below:

PL = 1 range 140.000 to 149.995
PL = 10 range 100.000 to 199.995
PL = 100 range 100.000 to 999.995
note reception above 999.995MHz and below 100.000MHz is possible but very poor selectivity.

Yeah, I know. I took three tests, too (two written, 20wpm code), and
all it says on my license is "extra". I feel a little miffed too.

Like what does "extra" mean? extra chopped liver (no thanks).

DEFINITIONS:

Date (day only)
Possible Magnitude of Solar Flaring (LOW=C-class, MOD=M-class, HIGH=M or X)
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)
```

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

| Geomagnetic Field |Fri|Sat|Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun| Anomaly |
| Conditions | Given in 8-hour UT intervals | Intensity |
|_____________________________________________________________________|
```

CONFIDENCE LEVEL: 65%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

------------------------------------------------------------
Chart Start: Day #161

NOTES:
The 10.7 cm solar radio flux is plotted from data reported
by the Penticton Radio Observatory (formerly the ARO from
Ottawa). High solar flux levels denote higher levels of
activity and a greater number of sunspot groups on the Sun.
The 90-day mean solar flux graph is charted from the 90-day
mean of the 10.7 cm solar radio flux.

1868. Re: Can anyone find mic holder?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 02:10:24 UTC
From: dwilson@s850.mwc.EDU
Message-ID: <9208070209.AA17229@ucsd.edu>
Source record: 286096

Thanks to all those for their suggestions to my search for
a hook type mic holder. The best solution came from
KK4GZ. It is to use a hollow wall anchor hook. I found
these in the hardware section of a building supply store.
Pack of 4 was $.79.

Source record: 286095

We are considering the purchase of a 92 Accord, and would be interested in other's experiences with this car and 2 meter mobile installations. Specifically, I'm concerned with the possibilities for RFI with the vehicles emmision control computer, etc. Furthermore, I would be interested in others approach to the physical location of the 2 meter mobile unit - there does not appear to be too much room available!.

1871. [ANS] rectifier tubes: 866=3B28 ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 02:28:10 UTC
From: jdelancy@tecnet1.jcte.jcs.mil
Message-ID: <9208070217.AA00170@tecnet1.jcte.jcs.mil>
Source record: 286098

Wayne --

Specs for the 3B28 and 866:

3B28 - Filament: 2.5 volts at 5.0 amps
DC Output current mA: 250
Max Inverse Peak Voltage: 10000
Peak Plate Current mA: 1000
Type: Gas

866A-AX: Filament: 2.5 volts at 5.0 amps
Max AC Voltage per plate: 3500
DC Output current mA: 250
Max Inverse Peak Voltage: 10000
Peak Plate Current mA: 1000
Type: Mercury Vapor

Pin connections for both are the same, 1-Filament, 2-Plate, 3-Plate
4-Filament.

I've made the assumption that you have the 866A. The 866B and 866jr
differ slightly. also note that the 3B28 does not have a Mac AC Voltage
per Plate rating.

Send your QSL for 5U7M's QSO to "JH4NMT thru JARL bureau".
All QSL of 5U7M is sent automatically thru the bureau. You will receive his QSL
without sending yours.

Yoshi (JH4NMT), one of my good friends, has been at Niger on his business
until next Spring. He had worked more than 30k Q's till now. As he is active
in the contests, you can find him easily in the contests.
Other friends help to print out his computerized logs and send printed QSL's
to the Bureaus.

I have not the address of V63OM here at office (^^), and I know his ex-call was
V63YL. Please look for the address of V63YL on any DX news. I remember "YL"
is his (!!) initial of his name.

Have a good DX

Ah, if only it were true. (I assume that you mean us -- I recognize the
contest-results flame.) Actually, I am interested in what factual
information you have used to reach this conclusion. I am certain that a
well-reasoned individual like yourself must have some basis for making
this otherwise-inflammatory statement.

> I joined the ARRL to try to get some positive changes happening...the basic
>theory being: If you're not involved you can't change it.

Quite true. Of course, I am glad that you realize that one can effect
positive changes only by being positive. :-)

>Well, the truth is
>even if you*are* involved you may not be able to change it! When K1ZZ finally
>wakes up to the situation on 10 meters...then, I'll be impressed. Meanwhile,

^^^^^

Oops. Now, Mr. Sorgatz, you can't really believe that you are going to
sway me to your way of thinking by insulting me, do you? I will, of course,
assume that you just forgot the smiley. :-)

>"When is the League going to insist that the FCC and the 'government-to-the-
>south' DO SOMETHING about those miserable bootleggers that are wiping out the
>28.0-28.175MHz portion of the 10 m band?!!!"

Just as soon as the FCC actually takes its marching orders from us. Ah,
persuasion by contradiction. :-).

> Would just one of you guys at HQ ask his honorable K1ZZ that question?
>PLEASE!

Actually, you could ask him directly. His mailing address is the same
as our Headquarters address. We have posted a list of HQ email addresses
from time to time. I will email you a copy.

Now, I would like to make a few points. Right after he took office, our
League President George Wilson paid the FCC head honchos a visit -- among

the many things he talked about was enforcement. I would like to think that his talks with the FCC played some role in the recent spate of enforcement actions we have seen coming from the FCC. Of course, I don't want to imply that they take their marching orders only from us! They are responding to a need -- one that has been pointed out to them by many different sources.

The other dead horse I will beat again is that K1ZZ (Dave Sumner) is not the one who will make the policy decisions about this type of thing. Policy is set by the ARRL Board of Directors. If you are unhappy with League policy in any matter, make your views known to your Division Director. I have seen too many ARRL Forums at conventions that are attended by less than 1% of the convention attendees! (These are mainly the OFs who are too enfeebled to walk around the booth area looking for bargains :-) :-)). Letters or phone calls work fine, too. Don't let these folks work in a vacuum and then complain if they don't get all of their decisions right. In spite of all one could say about the Board, I have met most of them -- they are dedicated, hard-working volunteers who give up over half of their weekends to attend hamfests, club meetings, conventions, etc., to make themselves available to you. If they can do this, can you (collective) spare as much of your time as you spend writing flames and posts to writing a well-reasoned letter to your Director?

Just some food for thought.

By the way, I believe these things because I work here -- I work here because I believe these things.

I had no trouble getting one of the Mitsubishi integrated PIN
diode switches, part number MD001H, from RF Parts
(619) 744 0700. This one is the 400-512MHz one, rated at 25W.
They sent me the data sheet (only the first page, though) from
the Mitsubishi databook. It only took one phone call;
maybe I was the lucky one!

The device performs as the spec sheet and Glenn say it does.
It's well worth any bit of trouble you have to take to get it.

> FN-25, and twice stations from New England have come back to me. The
> paths lastest just barely long enough to exchange reports; much less than
> minute. This leads me to suspect meteor scatter. These contacts were
> between 02:00 and 03:00 UTC (K1??? and W1MCF).
2

Sorry, but these QSOs weren't meteor scatter. They're too close.
I regularly work out to 300-400 km, easily reaching New England
from my QTH just south of you (FN24). You were just getting a little
help from the troposphere. With your setup and patience (or CW) you
could certainly work W2MCF, who is in Rhode Island, from Ottawa any
day of the week. In fact, he keeps skeds with several Ottawa guys
on 144.175 most evenings.

Meteor scatter is usually in the 500-1500 km range, beyond
"normal" tropospheric bending. That's why people get so exited
about it : the VHF version of DX.

You're right that meteor scatter is fun. Next week, you'll be able
to work a bunch of stations. Just turn your antenna southwest during
the late morning. It will be mostly quiet,
with sudden and exciting bursts every few minutes.
Skeds can be productive, too. Depends on what you like to do.

Al,

The ARRL Educational Activities Department can send you a printout
of local clubs and ham classes. Right now rwhite@arrl.org machine
is down, so FOR THIS ONE TIME ONLY send email to ehare@arrl.org, asking
for any or all of these items:

o Prospective ham package - info about ham radio -- includes also
the local club referral list
o Local club referral list
o Local ham class referral list

Right now these are not available electronically, so please include your
postal address and a specific request for the info or package you
want. (I hate it when I get email that says "Send it."

>for verbiage/information ratio, IMHO.)
>
I agree that a lot of their equipment is overrated- I have two pieces of MFJ equipment, a 300 watt tuner, and a keyer. The keyer once stopped working due to a faulty circuit board trace. After inspecting the board I was able to fix it with some solder and a wire. This circuit board is pretty simple, only 1 IC and some misc. components- I could probably do better with some etchant and resist tapes.
The antenna tuner has other problems: the SWR meter reads completely wrong on 10 meters, and on 80 I can almost never run more than 40-50 watts. The other antenna tuner I use is a Viking Matchbox- I think this unit is rated 275 watts, but on comparing it with the MFJ, you wuld think that it could run a KW (and it probably can). I frequently use open wire feed line- the MFJ is almost useless for this, as it uses a small toroidal balun (an inch or two in diameter).
I haven't used any of the higher power MFJ tuners, but I would guess that their KW model might be ok at the 100W level.

Aaron Endelman KK6QH endelman@eng.sun.com said:

I've been wondering about the quality of MFJ equipment. The only MFJ item
I own is the 300W transmatch w/dummy load. I've been pretty disappointed
at its inability to handle severe mismatches without arcing and melting
the capacitor plates, causing a short. After such episodes I've opened
the cover and had to take a needle file to the fused plates.

I own a very similar unit (model 948 I believe... the one without the
dummy load) and it was dead on arrival. I looked inside and discovered
that one of the taps had a solder whisker which shorted against the cover.
It was easy enough to fix, but caused me considerable grief at the time.
(First rig... homemade antenna... no prior experience... LOTS of self doubt)

Some folks on the net told me that MFJ really stands for Mighty Fine Junk.
Several others related their experiences with MFJ equipment. Most were
avoidable assembly errors. I guess the company has a poor reputation.

Not too long ago QST published an evaluation on that model. Their evaluation
unit was broken too. The meter cover would not stay in place and kept
falling off.

From the sound of things, it sounds like MFJ could use a little more
attention to the assembly process or perhaps change the design somewhat
to make it less vulnerable to assembly errors.

In all fairness though... Once repaired, the tuner works well enough
for me.

Especially when the name of the class is "Amateur Extra," you think
that if they went through the effort of making all the rules read
"Amateur Extra" they could at least get it right on the liceses
(at least that's the way it is on the old yellow ones).

Ron (Amateur Excellent Class), WO2L

1885. Re: MFJ quality?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 13:22:54 UTC
From: ron@pilot.njin.net
Message-ID: <Aug.7.09.22.53.1992.25060@pilot.njin.net>
Source record: 286118

MFJ's major problem is that there is no consistancy between different products, which makes it very difficult to decide whether they are worth dealing with. I purchased a 949 transmatch/SWR meter a few years back and it worked fabulously. When I went out to purchase a keyer I decided that MFJ was reasonable based on my 949 experience. The keyer is junk. It appears to be based on some 1970-ish QST article, it's iambic mode is unlike either of the Curtis A/B mode (I don't know the difference, but it drives the guy I bought it for crazy). It's internal wiring for both the keying circuit and the battery backup of the 2102 is bizarre to say the least.

-Ron

1886. Kenwood TM-321A/9600 baud?

Newsgroup: rec.radio.amateur.misc

1888. ICOM IC-M700 info wanted....

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 13:38:22 UTC
From: dejongh@dutiws.tudelft.nl
Message-ID: <1962@dutiws.tudelft.nl>
Source record: 286125

Remco den Besten (besten@chem.ruu.nl) writes >>>>>>>>>>>>>>>>>>>

Is there anyone who has info about the ICOM IC-M700?
The IC-M700 is a 'maritime shortwave transceiver' covering
2.000 - 23.999 MHz. The frequencies have to be programmed into a small
static-RAM after which these are selected by 'channel switches'
I like to modify the frequency input unit in such a way that everything
can be programmed by an encoder, thus creating a frequency dial.
The frequency synthesizing unit consists of several parts:
The input board with the numerical switches and RX/TX buttons to
enter the frequency. It also covers the display. Than there is a board
which has the processor (with a seperate I/O device) which of course reads
the data from the keyboard and channel switches. It programs the synthesizer
(any info on them? They are Mitsubishi M54929P's) and arranges the bandfilter
settings.
Is the IC-M700 an upgraded version (I can hardly believe it) of a 'normal'
shortwave transceiver. Or is it a limited version (that's more likely).
The one I have was in Holland an 'export deivce' due to its frequency coverage.
Perhaps there are different boards for the frequency synthesis, or at least
the input of the frequencies so that by replacing the input board, an
'amateur friendly' transceiver is obtained.
Perhaps someone knows something about how exactly the data from the keyboard
is forwarded to the processor so that perhaps a custom made thing can help.
What I know is that there is a lot of multiplexing going on. Without a logic
analyzer the job is almost impossible.
If anyone is familiar with the IC-M700, please mail me at:
besten@chem.ruu.nl or besten@hutruu54.bitnet

Thanks, Remco den Besten, PA3FYM

1889. *** ICOM Recalling IC-P2AT and IC-P4AT - fire and explosion hazard

Newsgroup: rec.radio.amateur.misc

From: ardai@zax.eda.teradyne.com
Message-ID: <1992Aug7.134523.26530@icd.teradyne.com>
Source record: 286127

I just received this message over the BARC club list and haven't seen it here yet...
/mike

----- Begin Included Message -----

From RES1!CREAMER@cdfq.ssd.ray.com Thu Aug 6 14:21:23 1992
Date: Thu, 6 Aug 92 14:06 EST
From: "Jesse Creamer, KC1YZ -- (617) 860-3183 (RAYNET 422-3183)"
<CREAMER%RES1@cdfq.ssd.ray.com>

Icom has announced a blanket recall for their IC-P2AT and IC-P4AT portable amateur radios.

There is a severe problem that necessitates a recall.

The lithum backup battery is defective and is opening up. The corrosive agents inside the battery will melt all adajcent electronic boards and the nicad battery pack.

If your battery pack is fully charged at the time of discharge, meltdown, fire and possible explosion will result. Nicads have a lower internal resistance and will give a much larger burst of electrical discharge (>10 amps are not uncommon).

Contact your original vendor where you purchased the unit(s) for more details or contact Icom at 1.206.454-7619.

Thank you. 73.

In addition the BBC have shown Wuthering heights in semaphore (you know flags being waved from hilltops. The dialogue consisted of empassioned cries (waves) of "Cathy" and "Heathcliffe" form two people running over the hills toward each other. OK so it was on Monty Python, but very innovative. Subtitles were provided for the hard of seeing. :-)

Morris is an intentionally deragatory term used by hams who are unable
or unwilling to learn Morse code or improve their Morse code skills.

Source record: 286126

KK6QH comments on arcing, etc in an MFJ antenna tuner. While I can't really comment on the quality of the MFJ unit, it's important to point out that virtually any antenna tuner can be destroyed at relatively low power levels if it is tuned up incorrectly. There is usually more than one setting that produces a match, but some of them may result in extremely high Q. This results in very large voltages and currents in the tuner. If the tuning is very sharp, and the adjustments are very critical, the Q is probably too high. Try a different inductance setting, etc. Usually, low Q is indicated when you can just barely get the SWR down to 1:1, and the reflected power null is broad. However, for any tuner there are some loads that just can't be matched with a low Q, so power ratings for tuners are quite arbitrary. One trick I use is to hold a neon bulb near the tuner capacitor terminal with it tuned up and about 100 W applied. If the bulb lights more than an inch or so away, there's probably lots of voltage there, and the Q is too high.

Note that in this case high Q is bad, and low Q is good. It may seeem strange, but the best efficiency occurs when the tuner Q is low.

1895. Re: Need advice from HW-101 experts

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 15:04:48 UTC
From: lkraft@hprnd.rose.hp.com
Message-ID: <30950023@hprnd.rose.hp.com>
Source record: 286133

I've found that many of the original tubes that came with my HW-101 became slightly gassy over time, causing this problem. (air gets in, ionizes, and causes current through the grid circuit). If you see a noticable blue glow inside any of the tubes, then there's a good chance it may be the problem. Some tubes do have a slight glow and don't seem to be troublesome.

My solution was just to replace the offenders with ones made by another vendor. Some vendors do a better job sealing their tubes than others.

Changing grid resistors will swamp out the effect of this spurious grid current, but the tube may progress to the point where you may need to lower the value again.

Hope this helps.

1903. Re: rec.radio.amateur.misc Frequently Asked Questions (all parts in one)

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 17:36:55 UTC
From: pschleck@cwis.unomaha.edu
Message-ID: <1992Aug7.173655.23506@news.unomaha.edu>
Source record: 286129

It seems Mr. Kantor and I (and the rest of the FAQ coordinators) will perpetually agree to disagree on the point of multi-part FAQ's. Without laboring the net with rehashing of the gory details once again, let me once more state for the record the method to our madness and why Brian's repost in concatentated format is thinly-veiled political grandstanding.

As opposed to the comp.graphics FAQ mess, we really don't object to the FAQ relayed to as many forums as possible, as long as it is done in a non-redundant way. Brian's posting of the FAQ's right after Ian posted them *IS* redundant, and wasteful. Brian's concerns about news and his mailing-list digest of this newsgroup are valid ones, but not in this context. A good newsreader (with threading) will make the multi-part nature of the FAQ's transparent, the multi-part nature a necessity of some Usenet sites (64K file limit). The use of several newsreader/digest-reader packages will allow readers of Info-Hams to easily skip over the FAQ's if they don't want to read them. There is also another solution (detailed below) that he claims to have implemented, which would render the whole conflict moot.

None of this is anything new as we (the FAQ coordinators) have spoken with Brian several times over the course of the past year-and-a-half. The solution that we were lead to believe had been implemented (filtering the FAQ's by Subject line out of the gateway and making them available via mail-server request) would obviate the need for Brian to object to the multi-part nature of the FAQ's. Again, this has been going on for about 18 months. Brian is the postmaster at ucsd.edu and surely has access to considerable technical resources to protect his mailing-list gateway as he sees fit. Why does he have to harrass those on Usenet for something that is essentially his problem?

Brian's post doubles the amount of disk space and net-bandwidth required for the monthly FAQ's. Since he doesn't use Expires: and Supersedes: headers like we do, it will disappear on sites with short hold times and hang around too long on sites with long hold times. There is no Reply-To: header to direct feedback to the coordinator's list (hamradio-faq@uts.amdahl.com) adding additional confusion.

If you object to Brian's tactics, please drop him some E-mail at brian@ucsd.edu. If you object to *MY* tactics, please send me some E-mail as well.

Paul W. Schleck, KD3FU

Cross-posted to: dc.general,rec.radio.amateur.misc,rec.radio.shortwave

I am posting this for a friend. He does not have news, so please
reply directly to him via email. His address is jayh@sco.com

Thanks for the help.

-=-=-=-=-= -=-=-=-=-= -=-=-=-=-= -=-=-=-=-= -=-=-=-=-= -=-=-=-=-= -=-=-=-=-=
Do you have a list of the local BBSs? I used to, a long, long time
ago. (maybe picked it up off of the dc.something, which we don't get
here)

I'd like to dial-in to a Ham Radio BBS in MD that has a list of local
scanner frequencies.

(I don't really want the BBS list, nor do I really want the BBS, what
I want is the list of frequencies.)

Well, I'll up the ante a little bit. I'm looking for a VHF (2m) antenna
to mount on a backpack frame and a mountain bike. Since it would be
used in rugged forested terrain, I envision a highly flexible vertical,
most likely a half wavelength antenna, since radials would be unwelcome.
A dual band antenna (2m/440) would be a bonus.

Since I'm not much of a builder, have precious few tools, and little
patience, I'd prefer something I could buy, but I'm open to all suggestions.

Anyone on here use radios on a mountain bike? I know of Bicycle Mobile
Hams of America, or some such, and plan on getting their newsletter.

...Joakim

Source record: 286139

I'm trying to use the CT contest program utility R2B to dump my entire logbook to CT binary format, so that I can use CT to get a handle on my DXCC-worked status. This program evidently converts text files (in the format used by some other logging program) to the CT .BIN format.

I tested the utility by converting a CT log to .RES format using B2R, and then running R2B on the result. I can't seem to successully convert it back to CT format. Can anyone help? thanks Mike N6MZ

1911. ---Albuquerque NM Hamfest---

1913. list of books on amateur radio (long)

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-07 21:36:07 UTC
From: isenhour@lambic.fnal.GOV
Message-ID: <0095EBF7.BE4AA460.438@lambic.fnal.gov>
Source record: 286141

I am learning more about the hobby so I grabbed this list to see what might be most informative, thought I would share it. Any comments on what might be 'real good' appreciated. I asked, and its ok for me to distribute this as long as the copyright stays intact and the distribution is free. The newest items appear first. Search terms were 'amateur' and 'radio'. I hate it when people say "ENJOY!"

If nothing else, MFJ seems to be consistent....

I bought the 1.5KW tuner. Upon unpacking it, I noticed that something was loose inside. When I opened it up I found a dime size solder blob that had been moving around. In addition, I found that five of the coil taps were not soldered at the inductor switch. Also, I found that of the two sets of solder lugs that allow the tuning caps to make contact, only one set was actually touching and that neither set had been soldered together.

These things were easy enough to fix and for the most part, the tuner works fine now as long as I don't ask it to do too much. Such as...

....tuning my 80 M dipole on 160 M. It arcs. Probably my own fault for even attempting such a thing.

....tuning an antenna on 10M. MFJ seems to count on the long internal wiring paths (and they are non trivial in the 1.5KW unit) for the inductance on 10M. Trouble seems to be that there is too much wire....the capacitors are usually at their minimum values when I use the tuner with a 10M antenna. It doesn't arc or anything, but the SWR seen by my transmitter is seldom any lower with then tuner in than with it out.

Concerning the 300W tuner.... a friend of mine has one of these and he noticed arcing under some pretty normal conditions. He stopped it by putting a sheet of insulation on the inside of the top cover....the caps had been arcing to it.

I've borrowed this particular 300W tuner, BTW, and it does better on 10M than my own 1.5KW tuner. My speculation is that the shorter wiring paths

allow MFJ to be in better control of the circuit inductance at this end of the tuning range.

>
>Youse guys sure love those special prefixes, eh? I've worked Canadians
>using CI, VG, XK, CF, CG, XO, VY, VX, VC, CJ, XM, XJ, VA, CK, XL and
>sundry other prefixes.
>
>I heard a rumor that Canadians were going to be allowed to use the special
>"VE" prefix soon, but I haven't managed to find one of these yet...

:-)

I notice you have never worked a station with a CH prefix :-). The CH prefix is supplied for special event stations (as opposed to a commemorative prefix like CJ right now for Canada's 125th Birthday) that is to run for a short duration. But, in the above case, the suffix was also special since it matches the Festival being celebrated! (Besides, VE6EHF is taken). Also, a special event callsign in Canada is FREE for the asking with appropriate explaination, while `regular' callsigns cost $22Can/Year ...

Now, why do we like these prefixes? Well, INSTANT pileups! We had GREAT fun using the callsign during those two days and that in itself has made it worth it. We worked ther station (3 position) in a valley during those two days and the prefix (and suffix) made us heard, while normally we are just another **** Canadian station!

Try it, Derek, you will like it, and then you will be hooked on these callsigns for LIFE !!! :-) :-) I am sure you can get a special event callsign for your local area events at a drop of a hat.

Ciao, 73 de CJ6MGS :-) /Mark -sk-

MFJ is a marketing company that markets average to poor quality equipment
extremely well! If you are another company in the same of line business
you don't compete against MFJ on quality you compete against their marketing.

Well Jerry, I won't critisize your choice (too much). Just let me say that nearly 30 years in the broadcast business leaves me with an understanding of the importance of good antennas, and an appreciation of the advantages and disadvantages of vertical antennas. To be really effective, verticals need to be in the clear and operated over an excellent ground surface. This is beyond the mere need for counterpoise. The R series is, or emulates, a half wave vertical and doesn't strictly require a counterpoise to operate. However, the conductivity of the ground surrounding *any* vertical out to about 10 wavelengths is critical to good performance. That's often a hard requirement to meet in amateur installations. Thus, horizontally polarized antennas are usually superior performers because they are less affected by ground conductance. Naturally, beams offer forward gain, and more importantly, rejection of signals to the rear and sides. This is usually a major advantage. Wire beams are cheap, much cheaper than the R5. They are often a good solution for amateurs and professionals alike. As you note, they aren't omni-directional which is both their advantage and their disadvantage.

I think what peeves me the most, and this isn't meant as a criticism of you, is the tendency of hams to buy expensive ready made antennas when wire is cheap and often more effective. A vertical antenna is really a simple structure at heart and home construction is often also simple and cheap.

I can't really see paying over $100 for some aluminum tubing when less than $5 of wire and a tree will do just as well.

In any event, have fun. That's what it's all about.

* KITSAT-A/OSCAR-23 LAUNCH TODAY! *
==================================
The 52nd Ariane launch is to place the TOPEX/POSEIDON satellite and two
auxiliary payloads, KITSAT-A and S80/T, into a quasi-circular 66 degree
inclined orbit using an Ariane 42P launch vehicle equipped with 2 solid
strap-on boosters (PAPs). This will be the 2nd launch of an Ariane 4
in the 42P configuration. It will be launched from the Ariane launch
complex ELA 2, in Kourou-French Guiana.

The launch vehicle performance requirement is 2,661 kg (5,868 lb), of which
2,502 kg (5,517 lb) represent the satellite mass. The total vehicle mass
at liftoff is 320,587 kg.

Required Orbit Characteristics:

Perigee Altitude ..... 1322 km
Apogee Altitude ...... 1330 km
Inclination .... 66 degrees

The Ariane 42P lift-off for Flight 52 is scheduled for Monday August 10,
1992, as soon as possible within the following launch window:

Kourou Time GMT Washington, DC
20:08 - 20:53 23:08 - 23:53 19:08 - 19:53

Launch Vehicle:

The Ariane 42P is a three-stage liquid fueled launcher with solid fueled
strap-on boosters. The first stage (L220) is built by Aerospatiale, and is
powered by 4 liquid fueled Viking V engines. The second stage (L33) is built
by MBB Erno and is powered by a single Viking IV engine. Both the Viking IV
and V engines are manufactured by SEP. The first and second stages use a
biliquid UH25/N2O4 fuel. The third stage (H10) is built by Aerospatiale,
and is powered by a cryogenic LH2/LO2 fueled HM-7B engine built by SEP.

The two strap-on boosters (PAP) are built by BPD and use a solid Flexadrine propellant. The fully assembled launch vehicle stands 55.2 meters high on the pad. It uses the Ariane Type 2 payload fairing.

Flight Profile:

+01:29 Solid strap-on booster jettison
+03:24 First stage separation
+03:48 Fairing jettison
+05:35 Second stage separation
+17:37 Third stage shutdown / orbit injection
+19:29 TOPEX/POSEIDON separation
+23:36 KITSAT-A and S80/T separation
+27:46 End of Ariane mission 52

Payloads:

TOPEX/POSEIDON is a cooperative program between NASA and CNES for studying the ocean surface topography. The satellite is built by FAIRCHILD SPACE under contract to NASA/JPL. For 3 to 5 years the altimeter payload will survey the ocean circulation on a global scale.

Total mass at lift-off ... 2,402 kg
Dry mass ..... 2,185 kg
On-board power ..... 2,140 W (end of life)
Solar panel span ..... 8.7 m
Orbital altitude ..... 1336 km

Instruments:

NASA altimeter and CNES altimeter (POSEIDON) for measuring ocean surface topography by radar.

TMR (TOPEX Microwave Radiometer) to measure atmospheric water vapor for correcting altimetric data.

Three systems of orbit determination to give precision satellite position:

LRA (Laser Reflective Array)
GPS (Global Positioning System)
DORIS (Doppler Orbitography and Radio positioning Integrated from Space)

In-flight operations:

Deployment of solar panels .... about 3 minutes after separation
Deploy of high-gain antenna ... about 8 minutes after separation
Deployment of GPS antenna ..... about 11 minutes after separation
Transition from DSN to TDRSS communications ... 16 minutes after separation
Beginning of high-gain TDRSS operations ..... 25 hours after separation
Beginning of maneuver to operational orbit .... about 7 days after launch

Auxiliary Payloads:

KITSAT-A uses the UoSAT platform built at University of Surrey (U.K.) for the Korean Advanced Institute of Science and Technology. It will be used for store and forward communications and various experiments.

Mass ..... 50 kg
On-board power ..... 21 W (end of life)
Nominal lifetime ..... 5 years
Satellite is 0.35 x 0.35m in size, with a 6m deployable mast

Instruments:

Two CCD cameras with 4 km and 400 m resolution
Digital signal processing experiment
Transponder for store and forward communications
In-orbit radiation measurement experiment

S80/T is built by MATRA MARCONI SPACE for CNES, also using a platform of the UoSAT type. It will be used to study use of the VHF band for mobile communications.

Mass ..... 50 kg
On-board power ..... 26 W
Nominal lifetime ..... 1 year
Satellite is 0.35 x 0.35m in size, with a 6m deployable mast

Payload:

1 transponder- 148-149.9 MHz reception
137-138.0 MHz transmission

Launch coverage:

All Ariane missions are broadcast live via satellite from Kourou. Coverage begins at 30 minutes before launch, and continues until all payloads have been deployed. NASA Select-TV will also broadcast this mission on F2/13 starting at 22:30 UTC.

1920. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-08 04:06:11 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Aug8.040611.1217@afit.af.mil>
Source record: 286147

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

> The people I've contacted, including those at the League, say
> they've never heard of any ruling or policy that precludes encrypted
> data.

I think you meant *compressed* data. *Encrypted* data is a no-no.
Now that cheap compressing software incorporates pretty good
encryption algorithms, we'll have to be careful.

The thing which the FCC is concerned about, it seems to me, is whether
or not the ham is trying to obscure the meaning of the transmission.
(See 97.113 (d).) Whether or not your local listening station is
Zip or Stuffit savvy is another question.

An Amateur Affiliate coordinator spoke at a club meeting in Boston
about a year ago. He told us about an incident in which local hams
exchanging ZIP files were contacted by the FCC and asked to explain
why they were transmitting in cypher. I may remember the story
wrong--it may have been a zealous but uninformed Amateur Auxiliary
who got upset, I don't know.

In any case, there remain no standards for "plain language" in the
world of compression. What if the FCC van doesn't have a Mac, and I
transmit a Stuffit file? What about less popular compression formats?
Compactor? FastBack? Norton? Not all compression software announces
itself in the header. What would you have to send to make the
FCC (and foreign PTT if you're DXing) happy?

From: Jim_Sollows@mindlink.bc.ca
Message-ID: <14098@mindlink.bc.ca>
Source record: 286151

To answer your question re. Is a J-Pole directional. In a word...yes..but not much I have heard claims that they even offer a certain amount of gain but the directivity is so small the gain can't be much. It's a good antenna design and seems to function well in all directions. Technically speaking the short stub is the director.

>
> Thus, radio observations are key this year to monitor
>the shower.

The purists here will certainly want to use the VHF ham bands to make these observations, but the sure fire way to get plenty of hits is to make use of the handy, high power radio beacons distributed all over North America by your friendly FM radio broadcast industry. With many stations operating at 100 kw or more, a decent FM receiver with outside antenna should steadily hear bursts of up to 5 - 10 seconds in length on a locally empty channel. Even a hot auto receiver might do the trick.

The FCC has allocated the commercial FM channels with certain power classifications. These frequencies generally will tend to have the highest power stations:

92.3, 92.5, 92.9, 93.1, 93.3, 93.7, 93.9, 94.1, 94.5, 94.7, 94.9, 95.1, 95.5, 95.7, 96.1, 96.3, 96.5, 96.7, 96.9, 97.3, 97.5, 97.9, 98.1, 98.3, 98.5, 98.7, 98.9, 99.1, 99.3, 99.5, 99.7, 99.9, 100.3, 100.5, 100.7, 101.1, 101.3, 101.5, 101.7, 101.9, 102.1, 102.5, 102.7, 102.9, 103.3, 103.7, 104.1, 104.3, 104.5, 104.7, 105.1, 105.3, 105.7, 106.1, 106.3, 106.5, 106.7, 106.9, 107.3, 107.5, 107.7, 107.9

Based on past experience, the lucky listener may hear distant stations popping in at a rate of several times/minute.

1927. Differences between IC-W2A DJ-580 FT-470 TH78A

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-08 15:34:40 UTC
From: johnr@mik.uky.edu
Message-ID: <johnr.713288080@mik.uky.edu>
Source record: 286161

Differences between: IC-W2A IC-24AT DJ-580T F-470 TH78A?

I posted a message about a week ago asking for users to tell me
that features each of these radios has. I got a few very informative
replies, however I am still uncertain. I was therefore wondering if
anyone could tell me that features any of the above radios lack.
For instance, I would appreciate knowing that all the radios lack
an alpha-numeric display with message capability except the Kenwood.

What I am looking for a is a dual band (2m/70cm) radio with tone-
squelch and CTCSS. This will be the first HT ever for me so I
am not very aware of what features to look for or what features might
be important to me.

I do know, however, that I saw that the Kenwood can monitor two
different frequencies on the same or different bands at the same time.
I know that the Icom cannot do that, but what about the others. I
think that this would be a useful feature.

I really like the Kenwood a lot, but if the Alinco has everything but
alpha-numeric paging then I would prefer to pay $100US less.

Thank you so much for your patience, time and efforts. This newsgroup
continues to exemplify the traditions of Ham radio!

1928. KENTUCKY: Central Repeater Frequencies

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-08 15:37:39 UTC
From: johnr@mik.uky.edu
Message-ID: <johnr.713288259@mik.uky.edu>
Source record: 286162
Cross-posted to: rec.radio.amateur.misc,uky.misc

I would very much appreciate knowing what the local repeater frequencies are. I am aware of one operated by the Bluegrass Ham Radio Club at 176.76 minus 600kz tx, however would like to learn about others. Is there a list? Should be.

Thanks for your help!

In article <382@arrl.org> ehare@arrl.org (Ed Hare KA1CV) writes:

>If you are unhappy with League
>policy in any matter, make your views known to your Division Director. I
>have seen too many ARRL Forums at conventions that are attended by less
>than 1% of the convention attendees! (These are mainly the OFs who are
>too enfeebled to walk around the booth area looking for bargains :-) :-)).

I've heard this point brought up a number of times. Has anyone
seriously considered WHY the ARRL forums are so poorly attended? From
what I've heard, other such forums (packet radio, satellites, etc)
which many not appear to the wide spectrum of the amatuer population
generally don't seem to have difficultly attracting attendees.

Thought I've not been an ARRL member for more than a decace, I know
that I wouldn't be attracted to a forum which effectivly bills itself
as "come piss and moan at the ARRL - let us know what you think."
What's in it for me? Is there some organized agenda, such as "ARRL
seeks input on HF packet forwarding" or "ARRL discusses new VE
procedures." If it's crap shoot, who's going to gamble that showing
up won't be a waste of time?

1930. Meteor Scatter??

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-08 16:13:12 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9208081614.AA28804@cmr.ncsl.nist.gov>
Source record: 286164

The Question:
>>Twice in the last week, I've been calling CQ towards the southeast from
>> FN-25, and twice stations from New England have come back to me. The
>> paths lastest just barely long enough to exchange reports; much less than
>> minute. This leads me to suspect meteor scatter. These contacts were
>> between 02:00 and 03:00 UTC (K1??? and W1MCF).
The Answer from W9IP/2: 2
>Sorry, but these QSOs weren't meteor scatter. They're too close.
>I regularly work out to 300-400 km, easily reaching New England
>from my QTH just south of you (FN24). You were just getting a little
>help from the troposphere. With your setup and patience (or CW) you
>could certainly work W2MCF, who is in Rhode Island, from Ottawa any
>day of the week. In fact, he keeps skeds with several Ottawa guys
>on 144.175 most evenings.
> etc....

My $0.02 Worth:
Mike, doesn't this also sound a bit like "Aircraft Scatter", as described by Kent Britain, WA5VJB, at the Central States Conference? For Those Who Care, Kent wrote a nice 5.5 page paper (which is in the Proceedings - buy from ARRL) covering aircraft scatter, including equations. Aircraft reflection patterns are very "glinty" and the geometry is only right for short periods, so the bursts described in the question seem to fit this mode. Absolute maximum communication range by reflection from an aircraft at the path midpoint:
Aircraft height: kilometers 3 6 9 12
Abs Max Comm path: km 510 700 830 990
At two meters, Kent calculates that signals reflected from a 747 are likely to be stronger than ordinary troposcatter beyond about 600 km - up to the distances shown above, where geometry says the aircraft can't be seen by both stations at the same time - no comm.
The 0100-0200 UT period is one in which a lot of transatlantic flights reach cruising altitude after leaving W/VE cities.

Could someone either post, mail, or direct me to a site with information on
TH-77 mods, as well as what you lose by performing the mods?
Actually, I'm interested in ANY info on the 77.
P.S. If you own any Kenwood TH- HT, hold down the M and PTT keys with the power
off, then power on. Various games have been reported to pop up. The 77 and 27
HT's play a silly slot machine game. No clue on why it's there.

From: br640@cleveland.Freenet.Edu
Message-ID: <1992Aug8.201610.22028@usenet.ins.cwru.edu>
Source record: 286165

I am considering getting a HAM radio, but I know nothing about technicalities..
Sooo......if someone could recommend one for me and give me the retail price,
it would be appreciated!!! I want a radio that allows me to transceive all frequencies
allowed by the liscence and to easily be able to communicate around
the world...something that can receive and trnsmit to hams anywhere...any suggestions???
Thanks,
Jason best

1933. Re: QST Content Revisited

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-08 21:30:13 UTC
From: alan@adept.UUCP
Message-ID: <512@adept.UUCP>
Source record: 286174

In article <14570458@hpnmdla.sr.hp.com> alanb@hpnmdla.sr.hp.com (Alan Bloom) writes:
>
>In the last year or two there has been a big increase in the cutesy-pie
>fiction stories. In my opinion, a few of these go a very long way.
>

I like a these stories just as much as the other articles that make up QST.

>Now, I'm an engineer, so I realize that I may have more technical
>interest than the average ham. But there are other types of non-technical
>stories that could be run. How about tutorials on operating DX or
>contests? When was the last time we had a description of grid squares
>and VHF/UHF weak-signal operating techniques? On a semi-technical
>level, how about an article covering receiver/transmitter specifications?
>It would describe what they are and which ones are important when choosing
>a radio to buy.
>

I am not an engineer, but I still agree here with Al. The DX articles have
been done in other amateur magazines, but a fresh view and hints would be
interesting. I would be interested in the VHF/UHF weak signal idea and
applaud the ideas about transmitter/receiver specs and importance to a
purchase.

>We've had plenty of "introduction to packet radio" type articles, so we
>probably don't need another that covers how to CONNECT through your TNC.
>But how about the next level up: An article covering NET/ROM, TCP/IP,
>ROSE, the future of high-speed data links, etc (in moderate technical
>detail) would be interesting.
>

I tired of my TNC and put my it in a box some time back. Now if we are
going to cover HIGH- SPEED links and protocols, count me in! How about
some follow ups to this with articles about what is being done by people
around the country, and maybe even a construction article?

Message-ID: <1992Aug8.221115.25006@samba.oit.unc.edu>
Source record: 286167

Jason, in answer to your broad question, let me first welcome you. Ham
Radio is a fine hobby and one that can lead to many employment paths.
The first step would be to write to the ARRL and ask for their prospective
ham package and a list of clubs and VE sessions in your local area.
The address is:
ARRL
225 Main St
Newington, CT. 06111

Ham Radios are just like cars. Some are used and are less expensive, some
are Yugo's and others like a Benz, but they can range from $100-5000.
My rig is a Kenwood 830s and with all the accessories, my station cost
about $1000 to put together. My first station cost much less.
Please email and let me know how it's coming along, OK !

I'm looking for ideas on how people have mounted mobile radios in
Caravans. Probably the best candidate place I have in my '92
is removing the ashtray and carving out a hole for the radio there.

I'll likely install a smaller radio, such as a Kenwood 732.

Thanks in advance for any ideas, particularily proven ones.

To SF from Portland 80 and 40 will be best. The skip is a little short for higher bands.

80 should be good from 3pm til dawn. 40 should be good all day and night, but better after dark.

HI !

I've got a President Lincoln 10meter amateur mobil transceiver.
This transceiver used to give a small BEEP after you press any
key on the front panel or even BEEPs when you key CW signals. -
But, this BEEP is not loud enough. Does anybody know if there
is a VR inside which I may tune so that the beep-sound is getting
louder ??!?

Any help welcome.

tnx es 73 de Pat, DD6PF.

In article <9208082231.AA28755@netmail.microsoft.com> mikemr@microsoft.COM writes:
>I received a "request" to substantiate my previous
>post concerning freebanders being fined by the FCC.
>Please see QST, August 1992, page 52, third full
>paragraph. Quoting QST, "...Notices of Apparent
>Liability (NAL) were sent to 54 so-called "freebanders"
>...The fines varied from $250-$3500..."
>

This must be the following paragraph:

In other actions on May 22, the FCC Field Operations Bureau
announced that notices of Apparent Liability (NAL) were sent to 54 so
called "freebanders," for unlicenced operation just outside the
26.96-27.41 MHz Citizen's Band. At least six of the 54 are licensed
amateurs. The fines varied from $250-3500, with operatots who failed to
permit inspections of their transmitting equipment receiving the
heftier NALs.

So, the question still is:

Who are these people?
Where do they live?
What did they do?
When were they apprehended?
Have they "coughed up"?
What are the call signs of the hams?

Do the FCC hide this info from us? I doubt it. Why don't QST
provide a full report? Local papers do a better job than this on crime
and court reporting.

As my old man used to say when yet another villain went free:
"Justice must not only be done, it must be seen to be done." This is
why we have public notices and open courts. To not report this stuff
fully and fairly does an injustice to the accused and the public who do
not see laws being applied.

I believe one of the few checks we have on tyranny is an open
court system. When they take us away at the dead of night and the only
thing anyone hears is that "criminals have been arrested", ten we are
in deep-deep bandini.

Sorry about the tirade.

Rec.radio.amateur.misc Frequently Asked Questions
Part 1 - Introduction
------------------------------------------------------------------------------

This is a regular posting of frequently-asked questions (FAQ) about Amateur
Radio, also known as Ham Radio. It is intended to summarize some common
questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list
as well as to help beginners get started.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

To reduce the size of each article, the FAQ information is posted in 6 parts:
Part 1 - Introduction
Part 2 - Beginning Amateur Radio questions
Part 3 - "Where can I find ..." computer questions
Part 4 - Amateur Radio Organizations and Publications
Part 5 - Common Advanced and Technical questions
Part 6 - Special Topics in Amateur Radio questions

Table of Contents
-----------------
Dates indicate last modification.

Part 1 - Introduction
** Table of Contents (7/92)
** How to Contribute to the FAQ Articles (7/92)
** Acknowledgements (7/92)
** Notes on "Netiquette" (4/92)

Part 2 - Beginning Amateur Radio questions
** What is Amateur Radio? (pre-4/92)
** Who can become a ham in the United States? (pre-4/92)
** OK, so how do I become a ham in the United States? (pre-4/92)
** Where can I locate information and books on Amateur Radio? (4/92)
** How much does it cost? (4/92)
```

** Where can I take the tests? (pre-4/92)
** What are the tests like? (4/92)
** What can I do with a ham radio license? (5/92)
** What can't I do with an Amateur Radio license? (pre-4/92)
** I'm interested, who will help me? (pre-4/92)
** Should I build my own equipment? (pre-4/92)
** Should I build my own antenna? (7/92)
** Do I need a huge antenna and tower like my neighbor? (pre-4/92)
** Where do I buy equipment? (pre-4/92)
** I've only got one 'meter' on the front of my radio - does this mean it's a 'one meter' radio? (Wow - some guys have 80 of 'em??? :-) (7/92)

Part 3 - "Where can I find ..." computer questions
** Where can I get ham radio software for my computer? (4/92)
** I don't have a news server at my site, how can I subscribe to the rec.radio.amateur groups? (4/92)
** I can read news at my site, but I don't have posting privileges. How can I post? (4/92)
** I don't have FTP capability at my site. Can I get files via email? (4/92)
** Where can I find Anonymous File Transfer Protocol (FTP) sites that have ham-related files? (7/92)
** I'm having trouble using FTP....HELP! (5/92)
** Are there any Telephone BBS's which have ham related files? (7/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Are there any on-line callbooks and geographical name servers? Access to FCC databases? (7/92)
** Where can I find modifications for my radio to extend its capabilities? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

Part 4 - Amateur Radio Organizations and Publications
** How do I use the incoming and outgoing QSL bureau? (pre-4/92)
** Anyone know anything about the QSL Post Office? (pre-4/92)
** Are there any news groups for CAP? (5/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** Can I send ARRL or W5YI electronic mail? (6/92)
** "Why doesn't the ARRL do...?" (4/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (pre-4/92)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (pre-4/92)
** Is there an on-line copy of the FCC Part 97, or FCC Amateur Radio allocations and question pools? (5/92)
** Can I post my neat new ham related program on rec.radio.amateur.misc? (pre-4/92)

Part 5 - Common Advanced and Technical questions
** What are the different US amateur classes and what can each of them do?

(pre-4/92)
** I'm confused. What do all those abbreviations mean??? (5/92)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(4/92)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (pre-4/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (pre-4/92)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies does JPL and GSFC retransmit the shuttle audio?
(5/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (new 4/92)

Part 6 - Special Topics in Amateur Radio questions
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 1--

** How to Contribute to the FAQ Articles

We accept suggestions from the Amateur Radio community. Please consider the
following criteria:
- is it a commonly asked question?
- will its inclusion help reduce the usage of network bandwidth?
- how useful is it to beginning Hams or to the majority of Hams?
Contributions don't have to meet all of these but the minimum is one. We
actually only ask that you consider these before contributing.

We can't necessarily include every question or every topic - the network simply
doesn't have enough bandwidth to carry that much information. Besides, the
point is that we're trying to conserve network bandwidth. You can find the
locations of much more information by referring to the "Index to the
rec.radio.amateur.* Supplemental Archives" posted monthly by Paul Schleck
KD3FU.

If you suggest a question for this FAQ, please include the answer. You'll
get credit for your contribution and you'll speed up the process of getting
the information ready for distribution.

If you feel your contribution is sufficient to meet the considerations shown above, send it to hamradio-faq@uts.amdahl.com so that it will reach all the FAQ coordinators: (listed in alphabetical order)

Ed Hare KA1CV ehare@arrl.org (Newington, CT, USA)
Ian Kluft (editor) KD6EUI ikluft@uts.amdahl.com (Santa Clara, CA, USA)
Michael Larish KD6CTZ nomad@ecst.csuchico.edu (Chico, CA, USA)
Paul Schleck KD3FU pschleck@unomaha.edu (Omaha, NE, USA)
Tom Sefranek WA1RHP tcs@ll.mit.edu (Shirley, MA, USA)
Chris Swartout N6WCP cas30@uts.amdahl.com (San Jose, CA, USA)
Diana Syriac KC1SP dls@genrad.com (Hudson, NH, USA)
Rosalie White WA1STO rwhite@arrl.org (Newington, CT, USA)
Derek Wills AA5BT oo7@astro.as.utexas.edu (Austin, TX, USA)

** Acknowledgements

All questions listed as modified "pre-4/92" are entirely Diana Syriac's work or her editing of a contributor's work. Diana established this FAQ. She is now one of the larger group that maintains it but we didn't want her effort to be lost in the crowd.

** Notes on "Netiquette"

The rec.radio.amateur.misc newsgroup and Info-Hams mail list have a large daily volume of traffic. They can operate more efficiently if the following netiquette guidelines are followed. Please take them seriously.
* When posting a followup article, ALWAYS try to minimize the number of lines of quoted material from the original article.
* As a general rule when you try to determine whether to reply to someone by e-mail or with a followup article, remember to "praise in public, criticize in private." It's OK to disagree technically but be careful not to attack the person with whom you disagree. Also, be careful with your use of the word "you" when posting a follow-up article. Many unnecessary flame wars have started that way.
* Use a descriptive subject. For example, a message subject of "Ham Radio" tells the reader NOTHING about the contents of your article since the whole newsgroup is about Ham Radio. Other examples of subjects which are so broad that they become useless could include, "Help," "A Question," "Antennas," or "Frequencies." Maybe "Books on Antennas?" or "Where can I find Repeater Frequencies?" would be better, for example. Remember, in a busy newsgroup a lot of users decide which articles to read from the subject line alone. If you post, don't deprive yourself of an audience!
* Before answering a question, check if the FAQ adequately answers it or if someone else already answered it. If you have more to add, make sure to reference either the FAQ or the related articles.
* If a user posts a question which is directly answered by the FAQ, there is no need to post an answer - the information is already available on the news-group. Instead, just send an e-mail message which politely explains where to find the FAQ. They will probably appreciate it if you include the answer to their question. (Don't send a "nastygram" - that would just discourage future participation.)
* Pay attention to the size of your audience - use the "Distribution:" header. If you leave it blank, your message will go to every civilized country in

the world and occupy disk space in all news systems in all those places. If that's what you intend, that's fine but make sure your article is relevant outside your country. (In particular, Hams should already know there is more to the world than just their own country.)
* If you have an item for sale, please limit the distribution area so that, for example, an article about a radio for sale in New Jersey won't get to California or Europe. If you wish, you may cross-post your for-sale article to rec.radio.swap.
* As also mentioned in Part 5 of the FAQ, software sources should be posted to either alt.sources, comp.sources.misc, or comp.sources.* for a specific machine type. Software binaries should be posted to the appropriate subgroup of comp.binaries.

Part 2 - Beginning Amateur Radio questions

Questions discussed in Part 2: (dates indicate last modification)
** What is Amateur Radio? (pre-4/92)
** Who can become a ham in the United States? (pre-4/92)
** OK, so how do I become a ham in the United States? (pre-4/92)
** Where can I locate information and books on Amateur Radio? (4/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 2--

** What is Amateur Radio?
Amateur Radio is a non-commercial radio communication service whose primary aim is public service and communication between private persons. Amateur Radio operators are commonly called hams. It's great fun to talk to someone in Japan on the radio! Here's one ham's description of Amateur Radio: "Climbing towers, roofs, trees, or any other fixed object to hang antennas. Restoring ancient equipment to operation. Playing with glitzy new equipment. Blowing up finals. Cutting holes in your (or your buddie's) car. Building your own stuff. Wiping out your neighbor's TV and then having to explain and fix it. The joy and magic of communicating with someone half way around the world with a few bits of glass and wire."

** Who can become a ham in the United States?
Anyone who is not a representative of a foreign government can

be an Amateur Radio operator in the USA. There are tests that you must pass to get a license, however the tests are not insurmountable. There are 7-year-old hams and 80-year-old hams. There are many handicapped hams who get great enjoyment out of Amateur Radio.

** OK, so how do I become a ham in the United States?
There are now two entry-level class licenses in Amateur Radio. A Novice license requires passing a 30-question written test and a Morse code test given at 5 words per minute. A Technician license requires passing the 30-question written Novice test and a 25-question written Technician test, but no Morse code test. See local radio clubs or radio stores in your area for more information. Note that you can get a higher class license instead, simply by passing the required tests.

** Where can I locate information and books on Amateur Radio?
Your local Radio Shack sells some ham radios and Amateur Radio license books. Books can also be obtained through the mail from ham radio organizations, such as ARRL in Newington, CT (203-666-1541) and W5YI in Dallas, TX (1-800-669-9594). There may be one or two ham radio stores in the local area (ie, within 50 miles). Try looking in the Yellow Pages under Radio Communications. Be assured that once you get a callsign, the mail order ham radio companies will find you :-).

For the Novice license, get a Novice License manual, plus 5-word-per-minute Morse code tapes, costing around $25. For the Technician license, get a combined Novice and Technician License manual, and an FCC Rules manual, costing around $32. (The combined manual is new and was made for the codeless Technician License.) The FCC Rules manual is a good idea for Novice also, but not necessary, since the Novice License manual contains all the FCC Rules that are required for the Novice License.

The ARRL Education Activities Department has several programs to help amateurs (or prospective amateurs) to get started. Ask for a "New prospect package" available free of charge, from ARRL HQ, Educational Activities Department, 225 Main St, Newington, CT 06111.

** How much does it cost?
To take the Novice tests, it's free. To take the Technician or higher class tests, there is a small charge (around $5-$6 currently) to cover copying costs and running the testing sessions. The cost of a radio is really dependent on what you want to do. You can make your own radio and antenna for under $150. You can buy a used single-band radio for $150-$300. Or you can buy a new multi-band multi-mode radio with all the doodads for $300-$3000. I'd suggest you learn more about ham radio, talk to local hams, find out what you want to do with ham radio first.

** Where can I take the tests?
The Novice tests can be given by any two qualified hams of General class license or above. The Technician tests and all higher class license tests are given by three qualified Volunteer Examiners (VEs) who volunteer their time.

To locate an ARRL testing session in your area, you can contact ARRL at 203-666-1541 x282.

** What are the tests like?
First off, come prepared to VE sessions. Bring: TWO forms of ID, one of which has a picture on it; a calculator (if necessary); a pen and two pencils; the applicable examination fee (around $5-$6 for 1992); the original AND a copy of your current Amateur Radio license (if you have one); the original AND a copy of any CSCEs for tests you've already passed (if you have any).

Each of the written tests (Novice, Technician, General, Advanced, and Extra) are generally a multiple choice test of approximately one-tenth of the question pool. For example, if the question pool is approximately 300 questions, then the test will be a 30-question test. You need to get 75% correct to pass. Note that they truncate to determine the correct number of questions. That means for a 30 question test, you need to get 22 right, which is actually only 73.3%.

Once you've paid the small fee for Technician-Extra tests, it costs no extra to take another test, so I'd suggest you keep taking the next more advanced test until you fail. If you pass the written but not the Morse code (or vice versa) for a specific class license, you have up to one year to take the other test before you would have to retake the written test again. Note that some VEs will not allow you to take the written test unless you've first taken the Morse code test.

The Morse code test is a receiving test only. The test run 5 to 7 minutes. After the test, you are given a 10-question multiple-choice or fill-in-the-blank test. Passing grade is 7 or more. If you fail the 10-question test, the examiner team will examine your copy sheet to see if you have 1 minute of solid copy with no errors. For 5 wpm, that's 25 characters, for 13 wpm, that's 65 characters, for 20 wpm, that's 100 characters. If they can find 1 minute solid copy, you've still passed.

Hints on Morse code tests: Generally, it will be a standard QSO (conversation), and it MUST contain at least one of each of the following:
26 letters A-Z, 10 numbers 0-9, comma (,), period (.), slant or slash (/), question mark (?), double dash prosign (BT), end of message prosign (AR), end of contact prosign (SK).
The letters count as one character, all others count as two characters. There are a couple other prosigns which are worth knowing, but will not be on the test, like "I'm done talking, next" is K, "I'm done talking, back to you" is KN, "Please wait" is AS.

** What can I do with a ham radio license?
There are so many things, it's a difficult question to answer, but
here's some ideas:
* Talk to people in foreign countries.
* Talk to people (both local and far away) on your drive to work.
* Help in emergencies by providing communications.
* Provide communications in parades or walkathons.
* Help other people become hams.
* Hook your computer to your radio and communicate by computers.
* Collect QSL cards (cards from other hams) from all over the
United States and foreign countries and receive awards.
* Participate in contests or Field Day events.
* Provide radio services to your local Civil Defense organization
thru ARES (Amateur Radio Emergency Service) or RACES (Radio Amateur
Civil Emergency Service).
* Aid members of the US military by joining MARS (Military Affiliate
Radio System).
* Participate in transmitter hunt games and maybe build your own
direction-finding equipment.
* Have someone to talk to on those sleepless nights at home.
* Receive weather pictures via satellites.
* Build radios, antennas, learn some electronics and radio theory.
* Talk to astronauts in space, or use the moon to bounce signals
back to people on the Earth.
* Experiment with Amateur TV (ATV), Slow-Scan TV (SSTV), or send
still-frame pictures by facsimile.
* Experiment with amateur satellite communications.

** What can't I do with an Amateur Radio license?
The most important thing you can't do is transact business of any
kind over ham radio. Interference to other hams or services, as
well as obscene, profane or indecent language is not tolerated and
is illegal. Music and broadcasting are not allowed on ham radio.
Some personal conversations may not be appropriate to Amateur Radio.
Do you really want the whole world to hear about Aunt Mabel's
hemorrhoids?

** I'm interested, who will help me?
There are hams who are willing to become "Elmers" (mentors, helpers)
in your local area. Look around and ask local hams. Search out
local radio clubs. As well, some people have volunteered to be
an Elmer over the Usenet. Paul has volunteered to maintain that
list. If anyone wants to be an Elmer, or needs an Elmer, email him:
Paul W. Schleck, KD3FU, pschleck@unomaha.edu

** Should I build my own equipment?
"Homebrewing" is a fun and educational part of ham radio. It is a
thrill to build your own transmitter and put it on the air. However,
building your own receiver can be quite complicated; if you don't have
electronics experience, you may want to buy a receiver instead. Most
homebrew transmitters are QRP (transmit very low power). That's fine
for an experienced ham with a very good antenna, but a Novice ham will

just get frustrated. Your first rig, therefore should NOT be a home-brew.

** Should I build my own antenna?
Most hams build their own antennas for base station use and buy antennas for mobile (car) use. Most beginner ham books describe how to build different types of antennas. Order of difficulty, from easiest to more difficult, for some common antennas are: wire dipole, Zepp, Yagi, Quad, and Log-Periodic. Books from many sources, including ARRL and several Hams, discuss antennas in depth.

** Do I need a huge antenna and tower like my neighbor?
No! Large beam antennas and 40-foot towers are very expensive. As a beginner, a simple dipole antenna is perfectly adequate. As you gain experience (and money :-), you may want to invest in something bigger.

** Where do I buy equipment?
If you can afford new rigs, there are many mail order stores that advertise in ham radio magazines. If you want to buy a used rig, the best place is at a "hamfest" (ham flea market). You should take along an experienced ham, since some of the used equipment may be inoperative, overpriced or poor quality. You can also answer ads in ham magazines or posted at ham radio stores, although often, by the time you call, the equipment has already been sold.

** I've only got one 'meter' on the front of my radio - does this mean it's a 'one meter' radio? (Wow - some guys have 80 of 'em??? :-)
Meter refers to the wavelength of the signal at which you are transmitting. There is a inverse relationship between the frequency (specified in kilohertz or megahertz) and the wavelength (specified in meters or centimeters). The relationship is described by the following formula:

wavelength (in meters) = 300 / frequency (in megahertz)

Part 3 - "Where can I find ..." computer questions

Questions discussed in Part 3: (dates indicate last modification)
** Where can I get ham radio software for my computer? (4/92)
** I don't have a news server at my site, how can I subscribe to the rec.radio.amateur groups? (4/92)
** I can read news at my site, but I don't have posting privileges. How can I post? (4/92)
** I don't have FTP capability at my site. Can I get files via email? (4/92)
** Where can I find Anonymous File Transfer Protocol (FTP) sites that have ham-related files? (7/92)
** I'm having trouble using FTP....HELP! (5/92)
** Are there any Telephone BBS's which have ham related files? (7/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Are there any on-line callbooks and geographical name servers? Access

to FCC databases? (7/92)
** Where can I find modifications for my radio to extend its capabilities?
(4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 3--

** Where can I get ham radio software for my computer?
Atari: John Adams KC5FW, 17106 Happy Hollow, San Antonio, TX 78232
"or tune into the weekly net Sundays 1600 UTC on 14.325 MHz".
MacIntosh: MacNet, John Seney WD1V 144 Pepperidge Dr, Manchester,
NH 03103 (sent 2 800k FORMATTED diskettes, one of which
contains a TEXT file containing your name, address, home PBBS,
your radio & computer interests and equipment).

(See also the information about Anonymous FTP and ham-related
telephone BBS's below.)

** I don't have a news server at my site, how can I subscribe to the
** rec.radio.amateur groups?
To subscribe to rec.radio.amateur.misc, send email to:

Info-Hams-Request@ucsd.edu (128.54.16.1)

In the body of the message, write:

subscribe Info-Hams

Similarly, to subscribe to rec.radio.amateur.packet, send email to
Packet-Radio-Request@ucsd.edu, message is "subscribe Packet-Radio",
and to subscribe to rec.radio.amateur.policy, send email to
Ham-Policy-Request@ucsd.edu, message is "subscribe Ham-Policy", and
to subscribe to rec.radio.shortwave, send email to
listserv@cuvma.columbia.edu (128.59.40.129), message is "subscribe
swl-l (your name)".

TO UNSUBSCRIBE, follow directions above, changing the command word
"subscribe" to "unsubscribe"; don't post to the newsgroup itself!
Help is available by using the command word "help". Note that command
words MUST be the first word on each line of the message.

Another mailing list of interest is antique-radios. To subscribe,
contact antique-radio-request@swbatl.sbc.com (Tom Adams). This mailing
list is for discussions on antique radio, television and vintage
electronics.

** I can read news at my site, but I don't have posting privileges. How
** can I post?
You can post to rec.radio.amateur.{misc,packet,policy}
by sending your posting email to Info-Hams, Packet-Radio, or
Ham-Policy, all at ucsd.edu. To post to other newsgroups, send the
posting email to (groupname)@ucbvax.berkeley.edu and for the
groupname, replace periods with dashes.

For example, to post to sci.space, you would send your posting to
sci-space@ucbvax.berkeley.edu.
All of the Amateur radio newgroups are archived on ucsd.edu under
subdirectory mailarchives/{Ham-Policy,Info-Hams,Packet-Radio}.

** I don't have FTP capability at my site. Can I get files via email?
ANY BITNET, EARN, or NorthNET site can access the Princeton mail
server. It will be most efficient if you know the complete path
and filename for anything you wish to transfer, but you can use
'cd' and 'ls -l' commands to move about and browse the remote site's
directories. The Archie database server may also be useful to search
for files and their directory locations on FTP sites around the world
(see below). Please be patient when using non-interactive mail
servers such as BITFTP as each request may take several hours (or
longer) to be fulfilled.

For access to the FTP server, send email to bitftp@pucc.bitnet (for
BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter.
The text of the email is the FTP commands one after another. For
example, suppose you wanted to access the FTP site lcs.mit.edu:
FTP lcs.mit.edu
USER anonymous
PASS yourname@yoursite (not required)
ASCII
CD telecom-archives
GET filenames
BYE
A help file is available giving detailed instructions by putting
the single word HELP into the text of the email.

For nonBITNET users, there is also a FTPMAIL server at
ftpmail@decwrl.dec.com (16.1.0.1). Commands include: REPLY
<mailaddr>, CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS,
COMPACT, UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>,
QUIT, HELP. Get the help file for more information by sending mail
with the single line "help". The ftpmail site may complain if you try
try to get more than 1 file per email request. Here is an example of
a request:
reply your_name@your_site
connect uxc.cso.uiuc.edu
binary
uuencode
get pub/ham-radio/Tech.v3.3.sit.hqx.Z
quit

A note on the use of FTP mailservers: If you want to use FTP
mailservers, like FTPMAIL, please be considerate of any systems that
your mail must pass through. The quickest way to find yourself cut
off from the world is to make the admins of sites that pass your mail
pass 60Mb of X11 graphics system source. If you need large amounts
of information from a mailserver, contact your admin for help -- it

may already be available, or he may know a better way to get it.

** Where can I find Anonymous File Transfer Protocol (FTP) sites that have ham-related files?
Tom Czarnik coordinates a fairly definitive list of anonymous FTP sites, their IP numbers, time zones, general contents, and access policies which he posts to the comp.misc, comp.sources.wanted, alt.sources.wanted, and news.answers newsgroups. It is itself available via anonymous FTP (how about that?? :-) from (among other places) pit-manager.mit.edu (18.172.1.27) under directory /pub/usenet/news.answers/ftp-list.

For specific information about exact locations of files by name, the Archie database server may be of help. Archie may be accessed by telnetting to one of the following sites (use the one closest to you):

Finland/Europe: archie.funet.fi (128.215.6.100)
Canada: archie.mcgill.ca (132.206.2.3)
Australia/New Zealand: archie.au (128.184.1.4)
Israel: cs.huji.ac.il (132.65.6.5)
UK/Ireland: raquel.doc.ic.ac.uk (146.169.11.3)
USA (Maryland): archie.sura.net (128.167.254.179)
USA (Nebraska): archie.unl.edu (129.93.1.14)
USA (New York): archie.ans.net (147.225.1.2)
USA (New Jersey): archie.rutgers.edu (128.6.18.15)

Login is archie. Type "help" at the prompt for a description of all server commands.

For those without telnet capability, the database may be accessed non-interactively via mail server. Send E-mail with the word "help" to archie@host where host is one of the Archie sites above.

The above two resources (the FTP list and the Archie server) are extremely powerful tools for finding out "what's out there" at various FTP sites around the world. *PLEASE* exhaust their capabilities before posting requests to the net.

The following is a brief summary of major ham-related FTP sites:

ftp.cs.buffalo.edu (128.205.32.9)
(submissions to this ftp site should be made to bowen@cs.buffalo.edu) - contains many ham radio files, including the FAQs, Elmer list, SWL and scanner info and the KA2UGQ worldwide BBS list on ~pub/ham-radio/phone_bbs_list

wsmr-simtel20.army.mil (192.88.110.20)
Keith Peterson, W8SDZ, has apparently returned as the maintainer of this huge repository of ham-radio (software and modifications), MS-DOS, and CP/M files. To find out how to submit files to this archive, please read his informational posts to the comp.binaries.ibm.pc.archives newsgroup. If you cannot directly FTP from wsmr-simtel20, there is a mail server

that can help. Send mail with the text "help" to
listserv@vm.ecs.rpi.edu (128.113.5.11).

wuarchive.wustl.edu (128.252.135.4)
A "mirror" of the files available on Simtel20, plus a *LOT*
more. A more user-friendly Unix environment (plus a faster
net connection) makes this site preferred over Simtel20.
If you are on a Unix box locally, see if your system
administrator will "NFS-mount" these files for faster/easier
access.

ucsd.edu (128.54.16.1)
The "home" site (with the most recent versions for the largest
number of different computer platforms) of the KA9Q TCP/IP
Network Operating System (NOS), other ham-related software,
and the archives for the Info-Hams, Packet-Radio, Ham-Policy,
and TCP-Group digests.

uxc.cso.uiuc.edu (128.174.5.50)
cd pub/ham-radio - This site contains the HyperCard Hamstacks
written by Diana Syriac as well as ASCII readable ham radio
question pools.

apple.com (130.43.2.2)
cd pub/ham-radio - Ham software and information, especially
MacIntosh software

ftp.uu.net (137.39.1.9)
wuarchive.wustl.edu (128.252.135.4)
wolfen.cc.uow.edu.au (130.130.68.4)
athene.uni-paderborn.de (131.234.2.32)
nic.funet.fi (128.214.6.100)
ham radio files and software for the Amiga computer system

charon.amdahl.com (129.212.11.1),
cd pub/radio/amateur - the most up-to-date copy of the FAQ.

If you experience difficulty connecting to the above FTP sites, read
the telnet/FTP troubleshooting hints below or check with your local
system administrator.

** I'm having trouble using FTP....HELP!
The unfortunate situation here is that Netnews is far more prevalent
than direct Internet hookups, accurate name servers, smart mailers and
routers, and of course, telnet and FTP client services. What this
means is that your trouble may be caused by MANY factors.

Here's some hints to check what's wrong:
* It may very well be that your newsfeed and email are via dialup line
and UUCP (Unix-to-Unix copy) in the wee hours of the morning. If
this is the case, then you have no direct connection to the Internet
and thus cannot use real-time interactive services like FTP and
telnet.

* If you are at a college or university, your host (ie, the computer you are logged onto) may be on the Bitnet network, which has an email gateway to the Internet, but no direct connect capability.
* If you do have a direct connection to the Internet, does your host have telnet and/or FTP client programs? (ie, if you type "ftp" or "telnet" at your command prompt, do you get anything?) Many hosts, particularly IBM mainframes, do not support these services!
* Can you telnet to other hosts and get a login prompt?
It may very well be that some hosts are "not recognized" due to misconfigured connections and inaccurate host tables/name servers (*.mil computers are *NOTORIOUS* for this!)
* If you get "host not in host table" or "host unknown" or similar error, try telnetting via the IP number, a set of four 1-3-digit numbers separated by periods (eg, 137.48.1.1). The exact IP number for the site can be obtained via the nslookup utility, if your computer supports it....or check the FAQs. Your host may not recognize the "fully-qualified domain name" (like callsign.cs.buffalo.edu), but it should ALWAYS recognize an IP number.
* If you get "network unreachable" check with some more knowledgeable users if your site is actually connected to the Internet. If it is, a link in the network may be temporarily disconnected for maintenance (or by accident.)
* In the case of telnetting to a non-default port (as in the case with the callbook servers), if telnet <host> <port#> doesn't work, but you can telnet to the default login port (ie, no qualifiers), then the manner at which the port qualifier is entered may be system dependent.
* Syntax for telnetting from different operating systems differ. Some common command syntaxes are: (angle brackets are for readability, do not type these in literally)

Berkeley Unix or VMS with Wollongong TCP/IP uses syntax:
telnet <host> <socket#>
Other possibilities to try:
telnet console <host> (for 2000 port)
telnet <CR> open <host>:<port#>
telnet <host>/<port#>
telnet <host>/port=<port#> (for Multinet on VMS)
* If all else fails, ASK your system administrator or check system documentation.
* Compression techniques are different for different operating systems. However, these hints should help: foo.sit needs MacIntosh UnStuffit to unstuff; foo.hqx needs MacIntosh BinHex to uncompress; foo.Z needs Unix 'uncompress' to uncompress or VMX compress_vms.exe (on gatekeeper.dec.com) will work too. If more than one method was used, like for foo.hqx.Z, start at the outside and work in (so uncompress on Unix with 'uncompress' first, transfer to MacIntosh, then uncompress with BinHex to get uncompressed file).
* There is an excellent introduction to FTP and archiving software

regularly posted to comp.binaries.ibm.pc.

** Are there any Telephone BBS's which have ham related files?
WB3FFV has one, phones are 301-625-0817 or 301-625-9482 or
301-625-9663. Data settings are 8 bits, NO parity, 1 stop bit.
Login is bbs, no password.
This BBS is also available via UUCP, login is uucpanon, no password.
For a listing of available archived, try:
uucp wb3ffv!~/FILES /usr/spool/uucppublic

Another one is N8EMR at phone 614-895-2553, login hbbs. Data settings
are 8 bits, NO parity, 1 stop bit. N8EMR has a comprehensive list of
other ham-related BBS's on-line.

** Are there Dialup News services or BBSs for Amateur Radio?
There are two major news services for ham radio. Both are run by
volunteer hams and provide bulletins of specific interest to amateurs,
hence they are perfectly legal to rebroadcast on ham bands according
to FCC Regulation 97.111B(6). To lessen the load on the dialup lines,
consider getting your local repeater operator to rebroadcast it, or
tape record it to play at your favorite HF net.

RAIN (Radio Amateur Information Network) is produced by Hap Holly,
KC9RP, located in Illinois. The news is typically updated 8am CST
Fridays. Phone numbers are 1-708-299-INFO (299-4636) and
1-708-827-RAIN (827-7246).

NEWSLINE is another, produced by Bill Pasternak, WA6ITF. Donations
for NEWSLINE are accepted at Newsline Support Fund, c/o Dr. Norm
Chalfin K6PGX, Pasadena, CA 91102. Phone numbers are:
Chicago 1-708-289-0423
N.Florida 1-407-259-4479
West Palm Beach 1-407-965-1234
Los Angeles 1-805-296-2407 (Instant Update Line)
Los Angeles 1-213-462-0008
NYC 1-718-353-2801
Ohio 1-513-275-9991
Seattle 1-206-368-3969

** Are there any on-line callbooks and geographical name servers? Access
to FCC databases?
If you are at an Internet site you can connect using telnet to one
of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.2)
ham.njit.edu (currently 128.235.1.10)

There is also a general geographical name server at:

martini.eecs.umich.edu (currently 141.212.100.9)

The callbook servers sit on port number 2000 and the geographical
name server sits on port 3000. These are different port numbers

than what telnet usually defaults to. So if you just telnet to these machines, you will get a login prompt instead of the server. How you tell your telnet program to connect to port 2000 or 3000 instead of the default port is operating system dependent but it is usually done with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, check the telnet/FTP troubleshooting hints above or consult your local systems guru for the proper command string.

The interactive servers are designed to be somewhat self-explanatory and they support fairly detailed help facilities. The first command you should execute when connecting to one of these servers is "info". This will list general info about that server and how to use it. You should then type "help" to list the various commands available. Typing "help" followed by a command name will give you a little more detail about that command. Servers allow searches by call, last name, zip code or city and also provide regular expression filters to trim your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty Carruth, N7IKQ. This database currently contains US and Canadian callsigns and it does not contain club calls. A new version of the database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com (The UUCP address is ...!uunet!dptspd!callbook). In the body of the text, say "lookup" followed by callsigns you want to look up. If your mailer appends signature files, you should put a line "quit" at the end of your request (before the signature file). If you want help, put the word "help" on a line by itself. Here is what a request might look like:

```
help
lookup kc1sp wn4bbj
lookup n0fzd
quit
```

There is another email callsign server at callbook@n8emr.cmhnet.org. The subject line is the list of callsigns to lookup. All other lines are ignored. This same callsign server can be accessed with packet radio via cbook@n3jyv.#cmh.oh.usa.na. The body of the message should include "REPLY n8jyv!HOME_BBS!CALL" (where HOME_BBS is YOUR home BBS, and CALL is YOUR callsign), carriage return, "CALL call1 call2 ..." (where call1 call2 .... is space separated list of callsigns you want to lookup).

If you are a packet radio station, callserver data is available from REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns, separated by spaces. For Canadian calls, use the callserver at REQQTH@VE3JF.ON.CAN. Body of message is ignored. The server is an OS interface to the MBL packet BBS using the Buckmaster CD-ROM

callsign database.

The REQQTH address is for the AX.25 radio-linked amateur packet network, *NOT* the Internet. If you attempt to send Internet mail to this address, and use the old .NA suffix instead of the new .NOAM suffix, it will get routed to Nimibia (Internet suffix .na) which is currently paying a lot of money for misdirected ham mail. Help maintain a positive example for amateur radio and please do not attempt this!

The FCC "call sign hotline" at 717-337-1212 is available for those who wish to listen to the call signs allocated in each group for each district. This requires only a touch-tone telephone to use.

** Where can I find modifications for my radio to extend its capabilities?
Some mods can be found on wsmr-simtel20.army.mil or
the Simtel20 mirror directories on wuarchive.wustl.edu.

There is a new server at pcserver@novell.business.uwo.ca. Some examples of main body email requests are as follows:
HELP
SENDME RADIO MODS
SENDME TH215 MODS
SENDME ALLBAND MODS

There is a packet radio Mods Server. To get the directories, send a packet as follows:
SP REQFIL@N2IMC.NJ.USA.NA
Subject: MODS\Dir.1
/EX
To get the mod, send to same place, with Subject MODS\Filename.ext.

REMEMBER that any modification is likely to void your warranty and that these mods are NOT guaranteed to work.

** Where can I find VE sessions in my local area?
VE sessions are often announced in the local newspapers, but more often, they are announced by local radio bulletin boards. The local packet BBS will most likely have a monthly updated schedule for VE sessions. ARRL or W5YI can generally be called and asked for local VE sessions as well. Don't forget that you will need the following when you go in for an upgrade: a copy of your current Amateur license; your original Amateur license; any CSCEs (duplicate not required), if applicable and less than a year old; a picture ID, preferably a driver's license, passport or visa; and the VE test fee (approximately $5 right now).

Bart Jahnke, KB9NM, the ARRL VEC Manager (bjahnke@arrl.org) posts a definitive listing of VE exams indexed by state (and some overseas sites, usually at embassies and military bases) to the net every 6 weeks or so.

** Why isn't XXX available electronically?
This is a theme for a lot of common questions. For the "XXX" above,
substitute any of the following:
Callbooks
DX QSL Lists
Radio station lists
ARRL publications (i.e. conference proceedings, repeater directory)
and more...

Except for the Callbook (via callsign servers), these are not available
because of any of several reasons. Either there are copyright restric-
tions, royalty fees, or the source just may not have done the work.
Also, not everyone that has information has reliable UseNet access.

In one example of someone's effort to bridge the information gap, there
is a new repeater-mapping project which can automatically accept
entries via e-mail. If you can get enough details about a repeater
for a complete listing, you may want to help by submitting an entry.
For more information, use the following e-mail addresses:

repeaters@wattres.sj.ca.us
Just send a message with only the word "help" in the message
body. The project's software will reply with instructions.
steve@wattres.sj.ca.us
For other questions (Steve Watt KD6GGD)

As soon as the list is big enough to be useful, the project will make
it available electronically. That will mean one less "why isn't it
available electronically" question for the net.

Part 4 - Amateur Radio Organizations and Publications

Questions discussed in Part 4: (dates indicate last modification)
** How do I use the incoming and outgoing QSL bureau? (pre-4/92)
** Anyone know anything about the QSL Post Office? (pre-4/92)
** Are there any news groups for CAP? (5/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** Can I send ARRL or W5YI electronic mail? (6/92)
** "Why doesn't the ARRL do...?" (4/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (pre-4/92)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (pre-4/92)
** Is there an on-line copy of the FCC Part 97, or FCC Amateur Radio
allocations and question pools? (5/92)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 4--

** How do I use the incoming and outgoing QSL bureau?
To use the outgoing QSL bureau, you must be a member of ARRL. In general, you send a bundle of foreign (not States!) QSL cards to the outgoing bureau in Newington, Connecticut, along with a label off of your QST magazine (which shows ARRL membership), along with $2 per pound of cards (approximately 150 cards) or $1 for 10 cards or less.

To use the incoming QSL bureau, you do NOT have to be a member of ARRL. Send one or more Self-Addressed Stamped Envelopes (size 5x7 or 6x9, NO BIGGER, NO SMALLER) with one ounce of postage attached and with your callsign in 3/4" letters in top left hand corner where the return address label would go. If you expect a large quantity of foreign QSL cards, attach extra money or postage with a paper clip; do NOT affix extra postage to envelope. Send the envelopes to the QSL bureau for your callsign area. If your callsign is xx3xxx/5, you would send it to the 3rd call area, NOT the 5th call area. Addresses for QSL bureaus are listed in QST (and below); if you don't have access to a QST magazine, ask another ham. IMPORTANT: BE PATIENT! Turnaround time for a US QSL bureau, not considering foreign QSL bureaus, is about 3 months. Foreign QSL bureaus and hams can be as fast as 2 months or as slow as TEN YEARS, while average is about 6-12 months.

Addresses for US Incoming QSL Bureaus:
USA 1 - W1 QSL Bureau, Box 216, Forest Park Stn, Springfield, MA 01108
USA 2 - ARRL 2nd District QSL Bureau NJDXA, POB 599, Morris Plains, NJ 07950
USA 3 - C-CARS, POB 448, New Kingstown, PA 17072-0448
USA 4 - All single-letter prefixes ONLY
Mecklenburg Amateur Radio Club, POB DX, Charlotte, NC 28220
others:Sterling Park Amateur Radio Club, Call Box 599, Sterling Park, VA 22170
USA 5 - ARRL 5th District DX QSL Bureau, POB 50625, Midland, TX 79701
USA 6 - ARRL 6th District DX QQSL Bureau, POB 1460, Sun Valley, CA 91352
USA 7 - Willamette Valley DX Club, POB 555, Portland, OR 97207
USA 8 - 8th Area QSL Bureau, POB 182165, Columbus, OH 43218-2165
USA 9 - Northern Illinois DX assn, Box 519, Elmhurst, IL 60126
USA 0 - W0 QSL Bureau, Ak-Sar-Ben Radio Club, POB 291, Omaha, NE 68101
Hawaii- Wayne Jones NH6GJ, POB 788, Wahiawa, HI 96786
Alaska- Alaska QSL Bureau, 4304 Garfield St, Anchorage, AK 99503

** Anyone know anything about the QSL Post Office?
The QSL Post Office is a private venture who also supplies QSL service as long as you let them put their advertisements in the envelopes. You can keep a SASE there in case you get cards returned via the QSLPO.

Instructions:
Send multiples of 10 QSL cards with check, cash or money order ($1 for each 10 cards).

Do not put postage on the cards.
Do not place cards in individual envelopes
Write callsign only in address area, or address as well if it's
different from callbook.
Send to:
QSL Post Office
767 South Xenon Court, #117
Lakewood, CO 90228
303-987-9442

** Are there any news groups for CAP?
There is no news group just for Civil Air Patrol discussions. However,
rec.aviation is appropriate for CAP aviation discussions and for
CAP radio information, these rec.radio.amateur.* groups are available.
CAP-related files are also stored on the FTP site
sunburn.cps.udayton.edu in pub/capital.

** What's the name of the QRP club that issues QRP numbers?
QRP Amateur Radio Club International, c/o Bill Harding K4AHK,
10923 Carters Oak Way, Burke, VA 22015.

** Can I send ARRL or W5YI electronic mail?
Several ARRL HQ staffers can be contacted via the net, using the
address username@arrl.org, replace username as shown below:

Jon Bloom, KE3Z, Laboratory Supervisor jbloom
(arrl.org postmaster)
Steve Ford, WB8IMY, Assistant Technical Editor sford
(Operating Manual, packet and satellite books)
Mike Gruber, WA1SVF, Laboratory Engineer mgruber
(product testing)
Jerry Hall, K1TD, Associate Technical Editor jhall
(Antenna books, propagation)
Ed Hare, KA1CV, Senior Laboratory Engineer (RFI) ehare
Rus Healy, NJ2L, QST Assistant Technical Editor rhealy
(Product Review)
Luck Hurder, KY1T, Field Services Dept. Deputy Manager lhurder
(Clubs, Field Organization)
Chuck Hutchinson, K8CH, Membershipship Services Manager chutch
(Contests, awards, DXCC etc.)
Bart Jahnke, KB9NM, Volunteer Examiner Dept. Manager bjahnke
(Exams, VE coordination, etc.)
Jim Kearman, KR1S, Assistant Technical Editor jkearman
(license manuals)
Joel Kleinman, N1BKE, Associate Technical Editor jkleinma
(in charge of editing technical books)
Zack Lau, KH6CP, Laboratory Engineer zlau
(RF/microwave circuit design, QRP)
Steve Mansfield, Public Relations Manager smansfie
(news stories, etc.)
Dave Newkirk, WJ1Z, QST Senior Assistant Tech. Editor dnewkirk

(Hints & Kinks)
Paul Pagel, N1FB, QST Associate Technical Editor ppagel
(in charge of QST technical editing, Technical Correspondence)
Rick Palm, K1CE, Field Services Manager rpalm
(Field Organization matters)
Bob Schetgen, KU7G, Assistant Technical Editor rschetge
(Handbook)
Barry Shelley, Chief Financial Officer bshelley
Dave Sumner, K1ZZ, Executive Vice President dsumner
(policy matters, HQ administration)
Rosalie White, WA1STO, Educational Activitied Dept. Mgr. rwhite
(info on becoming a ham/training/SAREX)
Mark Wilson, AA2Z, QST Managing Editor mwilson
Larry Wolfgang, WR1B, Senior Assistant lwolfgan
Technical Editor (Beginner's books)
Tammy-Beth Zimmerman, KA1WWP, Membership tzimmer
Services Administrative Assistant
(DXCC, awards, QSL buro)

The Washington Area Coordinator for the ARRL, Perry Williams W1UED
(sort of our "lobbyist" to the FCC and Congress) has mcimail access
at 2242662@mcimail.com.

Other mail addresses at ARRL:
Technical Information Service tis@arrl.org
(technical questions)
DXCC dxcc@arrl.org
Awards (WAS, etc.) awards@arrl.org
Contests contests@arrl.org
Outgoing QSL Bureau buro@arrl.org
W1AW 76067.3724@compuserve.com

For other questions (ARRL policy issues, etc.), try
2155052@mcimail.com, which sends them to the front office.

ARRL requests that you include your postal address (the slow kind) in
case they need to send you nonelectronic material in answer to your
request.

Other useful addresses:
Tom Frenaye, K1KI, Vice President 2349723@mcimail.com
Frank Butler, W4RH, Southeastern Division 3113659@mcimail.com
Director
Stan Horzepa, WA1LOU, QST (Packet horzepa@gdc.com
Perspective) and QEX (Gateway)
columnist
Fred Maia, W5YI, another large VEC 3511297@mcimail.com.

** "Why doesn't the ARRL do...?"
If you want the ARRL to do something, tell them! Direct input from a
concerned member (or, actually, any concerned Ham) carries a lot more
weight than hearsay from any source. The e-mail addresses are listed

above. They want direct input - that's what those addresses are for.

** What magazines are available for Ham Radio?
Your local ham store may have some, but here's some popular ones
(this is NOT a complete list!):
QST, ARRL, 225 Main St, Newington, CT 06111 - basic projects and
contesting
CQ The Radio Amateur's Journal, 76 North Broadway, Hicksville, NY
11801 - beginner ham radio articles
73 Amateur Radio Today, WGE Center, Forect Rd, Hancock, NH 03449,
FAX (603) 525-4423, email: COMPUSERVE 70310,775 or Internet
70310.775@compuserve.com - more technical ham radio articles
QEX, ARRL, 225 Main St, Newington, CT 06111 - more technical projects
WorldRadio, 2120 28th St, Sacramento, CA 95818, (916) 457-3655.
Subscriptions to 201 Lathrop Way, Ste D, Sacramento, CA 95815,
(800) 365-SUBS - lots of special interest columns, like QRP,
ATV, YL, etc.
W5YI Report, PO Box 565101, Dallas, TX 75356, 1-800-669-9594 -
up-to-date information on Amateur Radio happenings, including
VE information and statistics

** How do I become a 10-10 member?
10-10 is simply an organization to sponsor the use of the 10 meter
band. It was first conceived when propagation was poor on 10 meters,
as a method to get more hams to use 10 meters. The past few years
have been great for 10 meters worldwide. However, "the bands are
closing down" again, and 10 meters will once again be limited more
for local communications, except for sporadic band openings, until
the next sunspot cycle.

To join 10-10, work ten 10-10 members and LOG each 10-10 number, call
sign, operator's name and location. Send the list to your numeric
call sign or DX area manager (as shown below), with $5.00 U.S. new
membership registration fee ($6.00 for foreign addresses).

10-10 International Area Managers:
USA 1 - Al Kaiser N1API, 194 Glen Hills Rd, Meriden, CT 06450
USA 2 - Larry Berger WA2SUH, 9 Nancy Blvd, Merrick, NY 11566
USA 3 - Chester Gardner N3GZE, 9028 Overhill Dr, Ellicott Cty,MD 21042
USA 4 - KY, TN, FL, VA, NC, SC only
Rick Roberts N4KCC, 7106 Ridgestone Dr,Ooltewah, TN 37363
USA 4 - GA, AL, Puerto Rico only
Jim Beswick W4YHF, 112 Owl Town Farm, Ellijay, GA 30540
USA 5 - Grace Dunlap K5MRU,* Box 445, LaFeria, TX 78559
*summer addr Jun-Oct Box 13, Rand, CO 80473
USA 6 - Dick Rauschler W6ANK, 4371 Cambria St, Fremont, CA 94538
USA 7 - Willie Madison WB7VZI, 10512 W Butler Dr, Peoria, AZ 85345
USA 8 - John Hugentober N3FU, 4441 Andreas Ave, Cincinatti, OH 45211
USA 9 - Jim Williams N9HHU, 240 Park Rd, Creve Coeur, IL 61611
USA 0 - Debbie Peterson KF0NV, RR 1 Box 35, Duncombe, IA 50532
All DX- Carol Hugentober K8DHK,4441 Andreas Ave, Cincinatti, OH 45211

** How do I join MARS?
To join MARS, you have to be 14 years or older (parental consent required under age 17), be a US citizen or resident alien, possess a valid Amateur Radio license, possess a station capable of operating on MARS HF frequencies, and be able to operate the minimum amount of time for each quarter (12 hours for Army and Air Force; 18 hours for Navy-Marines). Novices must upgrade to Technician within 6 months, else be dropped from MARS. No-Code Techs can apply, provided they have transmit and receive HF capability for MARS frequencies (they don't need transmit capability for Amateur HF frequencies). For application forms contact:

Chief, Air Force MARS
TIC/DLTXM
Scott AFB, ILL 62225-6001
(618) 256-5552. Or, contact via Internet goes to
__daniels@server.af.mil, put "Pass to MSgt Trimmer" in subject line.

Chief, Army MARS
HQ, US Army Information Systems Command
ATTN: AS-OPS-OA
Fort Huachuca, AZ 85613-5000

Chief, Navy-Marine Corps MARS
Naval Communication Unit
Washington, DC 20397-5161

** How do I join RACES?
Contact your nearest Civil Defense or Emergency Management Agency. The Radio Amateur Civil Emergency Service is a part of a municipal, county, or state government. This does not mean, however, that every such government has a RACES program. If your government does not have a RACES, ask them to refer you to the nearest jurisdiction that does have a RACES program.

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it thru 2155052@mcimail.com) and a book called "The ARRL Plan for the Disabled", available at no charge from the ARRL Regulatory Information Branch.

** I am looking for a specific ham, can anyone help me find him?
Rather than sending out a message on Usenet, you might first try directory assistance from the phone company or the locator service provided by the Salvation Army. A Salvation Army post in your local area may be able to help you. If you have his/her callsign or name, you might also try one of the on-line callservers shown above. Also, the Quarter-Century Wireless Assn maintains a collection

of callbooks going back to "the beginning of time". Their address
is: 1409 Cooper Drive, Irving, TX 75061. Also, the Callbook has a
dial-in line for accessing new ham callsigns. Try (1-708-234-8011)
at 2400 baud.

** Is there an on-line copy of the FCC Part 97, or FCC Amateur Radio
** allocations or question pools?
Part 97 is available by ftp from several locations:
Western US
caticsuf.cati.csufresno.edu /pub/ham-radio/radio/info/part97.txt
Central US
pacific.mps.ohio-state.edu /msdos/ham/part97.arc
Eastern US
gandalf.umcs.maine.edu /pub/ham-radio/part97.txt
ftp.uu.net /networking/ka9q/part97.arc
The *.arc files are MSDOS ARC files with the same ASCII text.

An ASCII copy of the question pools are available by ftp from
uxc.cso.uiuc.edu (128.174.5.50) in /pub/ham-radio/<class>-pool.txt.Z,
where <class> is novice, technician, general, advanced or extra.

** Can I post my neat new ham related program on rec.radio.amateur.misc?
This is really not a good idea, since many of the readers receive
these newsgroups as mail digests. Posting is also a one-shot thing.
If you post and someone missed it, it is gone. A better way would be
to announce the existence of your program here, along with
information on how to obtain a copy of your program. You can also
submit it to one of the FTP archive sites, which will allow the world
to access it without you having to mail it to each requestor. If you
just GOTTA post it somewhere, post it to more appropriate groups,
like comp.sources.unix or alt.sources or comp.binaries.ibm.pc.

Part 5 - Common Advanced and Technical questions

Questions discussed in Part 5: (dates indicate last modification)
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** I'm confused. What do all those abbreviations mean??? (5/92)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(4/92)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (pre-4/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (pre-4/92)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies does JPL and GSFC retransmit the shuttle audio?
(5/92)
** Can I take my HT on an airplane and operate it if I get the permission

of the captain? (4/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (new 4/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 5--

** What are the different US amateur classes and what can each of them do?
Novice - has CW (Morse code) privileges on 4 HF bands (80, 40, 15,
and 10 meter), Voice privileges on 10 meters, and privileges
on 2 VHF/UHF bands (220 MHz and 1290 MHz).
Required are 5 wpm Morse code test and 30-question Novice test.
Technician - has full privileges on all VHF/UHF bands above 30 MHz.
Required are Novice test and 25-question Tech test.
Technician may access Novice HF bands by passing the 5 wpm Morse
code test.
General - has all Technician privileges, plus larger access to more
HF bands, including CW and Voice on 160, 80, 40, 30, 20, 17, 15,
12, and 10 meter bands. A General class amateur can give Novice
tests.
Required are 13 wpm Morse code test, Novice, Tech and 25-question
General test.
Advanced - has all General privileges, plus wider band access on 80,
40, 20, and 15 meter bands. An Advanced class amateur can
also become a VE and give tests to Novice and Tech tests.
Required are 13 wpm Morse code test, Novice, Tech, General and
50-question Advanced test. The Advanced test is the most difficult
of the five written tests.
Amateur Extra - has full privileges on all amateur bands. An Extra
can become a VE and give all amateur tests.
Required are 20 wpm Morse code test, Novice, Tech, General,
Advanced and 40-question Extra test.

** I'm confused. What do all those abbreviations mean???
AM Amplitude Modulation
AMSAT Amateur Satellite Corporation
AMTOR Amateur Teleprinter Over Radio. A more sophisticated version
of RTTY. Also used commercially as SITOR (Simplex Teleprinter
Over Radio).
ARRL American Radio Relay League
ATV Amateur Television - a way to see who you're talking to!
CAP Civil Air Patrol is a volunteer organization that searches for
downed aircraft and missing kids and uses frequencies just
outside of the ham bands and often uses modified Amateur radios
CB Citizen's Band radio, this is NOT part of Amateur Radio and
does not require any license to operate
CQ An on-the-air request for a conversation with anyone
"dupes" A dupe sheet is a duplicate check sheet, in matrix format, used
to quickly check that you have not had a "duplicate" contact
with someone (on a specific band or mode) in a contest
Elmer An amateur radio mentor, or "Master Craftsman" to a new ham.

Could refer to anyone, regardless of age or gender.
FCC Federal Communications Commission, the "law enforcers"
FM Frequency Modulation
FieldDay A June activity to practice emergency communications for
24 hours....wives call it 'an exercise in male bonding' :-).
HF High Frequency - 3 MHz to 30 MHz
HT Handy-Talky, a shorthand for "hand held radio"
LF Low Frequency - 30 kHz to 3 MHz
MARS Military Affiliate Radio System, military affiliated Amateurs
who provide free communications for overseas GIs and other
Federal services. MARS operators are licensed under DoD
instead of FCC.
NTS National Traffic System, a way to send radiograms
OF Old Friend, or Old F#$%, used to denote an older ham
OM Old Man, refers to any ham, including female hams
packet computer bulletin boards/electronic mail via Amateur Radio
PRB Private Radio Bureau, administers Amateur and CB services
QSO One of the Q signals used in Morse code to mean "conversation"
QCWA Quarter Century Wireless Association, membership means you've
been a ham for more than 25 years
RTTY Radio Teletype - older form of computer communications on HF
SAREX In Amateur Radio talk, Shuttle Amateur Radio EXperiment, a
chance to talk to astronauts in space. In CAP talk, Search
and Rescue EXercise, practicing for the real thing.
SK Silent Key, a nice polite way to say a ham has passed on "to
that great antenna farm in the sky"
SSB Single Side Band - need less band width than AM or FM
SSTV Slow Scan TeleVision - REALLY slow, low data rate, typically
used on the lower frequency bands
UHF Ultra High Frequency - 300 MHz and above
ULF Ultra Low Frequency - 30 Hz to 300 Hz
VHF Very High Frequency - 30 MHz to 300 MHz
VLF Very Low Frequency - 300 Hz to 30 kHz, audio frequencies
WARC World Administrative Radio Conference, a summit meeting that
occurs every few years, required by international treaty to
determine how the spectrum get sliced up to all vying
communications services (last one was in 1992)
XYL eX-Young Lady, or wife
YL Young Lady, non-ham girlfriend or female ham
2m Shorthand for "2 meters" (144-147.995 MHz), which is a
reference to the wavelength of a common Amateur frequency
band used for local communications

** What do all those "tones" mean?
Sub-Audible Tone: A low tone that you're not supposed to be able to
hear. It's used as a "PL Tone." PL is "Private Line", a trademark
of Motorola for their implementation of CTCSS (Continuous Tone Coded
Squelch System). Basically, the transmitter sends the signal with
the Sub-Audible tone and the receiver only opens when it hears signals
with that tone. Signals without the proper tone are ignored. This

is useful for "closed" repeaters, or for repeaters on the same
frequency that have overlapping geographic areas.
Tone encode refers to the feature of providing the tone on transmit.
Tone decode refers to the feature of responding to the tone on receive.
Tone squelch refers to all of the above. DTMF refers to Dual Tone
Multi-Frequency, or "Touch Tone" which is a trademark of AT&T. DTSS
probably means Dual Tone Squelch System and refers to the feature of
providing a predefined sequence of Touch Tone digits to open the
repeater for transmit. DTSS is an alternate method from CTCSS, which
provides a way to use a "closed" repeater even if your radio doesn't
do Sub-Audible Tones.

** Where can I learn more about Amateur Radio if I live outside the US?
Write to the ARRL and ask. They can usually tell you how to get a
license in your country.

If you know of any location where this information is available
electronically, whether by an e-mail server, anonymous FTP, or a
contact person, please mail it to us so we can include it here. Send
it to hamradio-faq@uts.amdahl.com.

** How can I get a "reciprocal license" if I am a licensed ham from another
** country or if I am a FCC licensed ham who wants to operate in another
** country (on vacation)?
You need to submit a FCC Form 610-A to the FCC, PO Box 1020,
Gettysburg, PA 17326. They will then send you a reciprocal permit
for alien amateur licensee (FCC Form 610-AL). You must be a citizen
of a country with which the United States has arrangements to grant
reciprocal operating permits to visiting alien Amateur operators.

For FCC licensed hams operating abroad, the following guidelines
apply:
* A reciprocal license is required in all foreign countries (that have
a reciprocal operating agreement with the US), except Canada, where
the FCC license is automatically valid.
* Send a SASE to ARRL Regulatory Information Branch, telling them
which country you are going to visit and they will send you the
info and an application form. Foreign hams can likewise request
information from their national Amateur radio society.
* Submit your application with a certified copy of your Amateur
license (ie, notarized copy), and fee if applicable (use a bank draft
of a bank that does business in that country) to the appropriate
licensing administration of the foreign country. Processing may
take 30 to 90 days.
* If less than one month, you could try sending the application and
pick up the permit upon arrival in that country.
* Most countries will not allow you to bring communications equipment
into their country without a license or permit. If you applied, but
haven't received the permit yet, show the copy and your FCC license
to the customs officer, however, the equipment may still be held at
customs until your departure.

* Be sure to use only those frequencies covered by your FCC license which are also used in the foreign country, unless otherwise authorized.

** My apartment or housing complex does not allow outdoor antennas, now what do I do?
First of all, don't despair. Many hams have similar problems. Many books offer advice for the growing group of hams that cannot put up antennas. Some options are:
* Install an "invisible" antenna made of magnet wire.
* Disguise an antenna as a flag pole.
* Install an antenna in the attic.
* ASK the apartment manager. You may find they will let you put up something as long as it "is invisible" or "doesn't disturb your neighbors" or "doesn't attract lightning".
* Operate primarily from your car.
* If the restriction is due to local ordinance, you may have relief via PRB-1. Meet with the local government and seek an informal compromise. It is possible to win in court...but it's expensive and time consuming.
* If you are restricted by "covenants" attached to the deed of your home, your options are severely limited. Covenants are considered to be private, voluntary contracts between individuals and are outside of the intended application of PRB-1. In many cases, you can petition the Homeowner's Association for an exception. Sometimes you can win in court on the basis that other violations of the covenants by others without action taken constitutes abandonment of the agreement.
* For further information, contact the General Consel's office of the ARRL, 225 Main St, Newington, CT 06111.

** I got TVI...HELP!!!
Here's some hints on Television interference, but this is not a complete list. There are also books on the subject available from ARRL.
* If cable TV is an underground feed, look for central distribution box. Check for a grounding rod.
* Try installing torroids on the cable TV cable close to the TV, and maybe torroids on the AC cord as well.
* VCRs are notorious for RF leakers, try disconnecting the VCR.
* Check to see if interference is better or worse when cable is disconnected and you use rabbit ears instead. It could be the cable company's problem!
* Calling the cable company may get results, since they are also responsible for RF leakage from their equipment. However, they are very often obstinate. Good luck! Try some or all of these suggestions before calling the cable company:
1. Log the interference, noting geographical location, frequency, and characteristics.
2. Bring it to the cable company's attention in writing, preferably addressed to "Chief Engineer", or "Technical Staff".

3. Don't be accusatory, instead ask for assistance in resolving
the problem. Try to work it out with someone technically
knowledgeable.
4. Do mention your "licensed radio system", but try not to be too
specific about "ham" or "CB" unless requested.
* Try moving the radio antenna further away from the TV sets. Make
sure the SWR is LOW.

** Did you know that you can get college credit for being a ham?
It's true! You can receive up to 14 credits in electronics and
engineering thru placement tests for CLEP (College Level Entrance
Placement) exams and DANTES (Defense Activity for Non-Traditional
Educational Support) exams if you have an Advanced or Extra class
Amateur license. For more information, ask your campus education
office or (for DANTES) your military education office.

** On what frequencies does JPL and GSFC retransmit the shuttle audio?
Station VHF 10m 15m 20m 40m 80m Video
WA3NAN 147.45 28.650 21.395 14.295 7.185 3.860
W6VIO 224.04 21.280 14.282 7.165
K6MF 145.585 7.165 3.840
W5RRR 146.64 28.495 21.350 14.280 7.227 3.850
W6FXN 145.46
KA9SZX 146.88 426.25

All frequencies are in MHz. Use FM on VHF, USB on 10-20m, LSB on
40-80m.
WA3NAN - NASA Goddard Space Flight Center (GSFC), Greenbelt, MD
W6VIO - NASA Jet Propulsion Laboratory (JPL), Pasadena, CA
K6MF - NASA Ames Research Center (ARC), Moffett Field, CA
W5RRR - NASA Johnson Space Center, Houston, TX
W6FXN - Los Angeles, CA
KA9SZX - Champaign-Urbana, IL

** Can I take my HT on an airplane and operate it if I get the permission
of the captain?

Technically, maybe. But don't count on it. In general, you can't use
a radio or scanner on an airline (or charter) *unless* the airline
allows it and the pilot-in-command (PIC) determines that it will not
interfere with the instruments and radios on that specific aircraft.
Very few US airlines allow passengers to use radios so be ready to
disconnect the antenna when you ask. (Don't even ask to transmit.)
For reference (in the US) the pertinent portion of the Federal Aviation
Regulations (FARs) is Part 91, paragraph 91.21.

Due to airport security, you may have a little difficulty carrying the
HT (or any electronic equipment) onto the airplane. Generally, you
can appease the security guards, simply by showing that the unit is
operational and doesn't have a bomb inside. For a radio, just turning
it on and opening the squelch satisfies them. Expect more difficulty
during periods of increased security.

On a private airplane, it is legal to operate an amateur radio if you have the permission of the PIC. It is still possible for the radio to interfere with the plane's navigation or communication equipment, so be sure to ask first. Always obey the requests of the PIC. He knows his airplane and radios better than you do.

** What is the standard for measuring Morse code speed?

The word PARIS was chosen as the standard length for CW code speed. Each dit counts for one count, each dash counts for three counts, intra-character spacing is one count, inter-character spacing is three counts and inter-word spacing is seven counts, so the word PARIS is exactly 50 counts:

```
PPPPPPPPPPPPP AAAAA RRRRRRRRR IIIII SSSSSSSSS
. - - . . - . - . . . . . .
1 1 3 1 3 1 1 3 1 1 3 3 1 1 3 1 1 3 1 1 1 3 1 1 1 1 1 7 = 50
^ ^ ^
^Intra-character ^Inter-character Inter-word^
```

So 5 words-per-minute = 250 counts-per-minute / 50 counts-per-word or one count every 240 milliseconds. 13 words-per-minute is one count every ~92.3 milliseconds. This method of sending code is sometimes called "Slow Code", because at 5 wpm it sounds VERY SLOW.

The "Farnsworth" method is accomplished by sending the dits and dashes and intra-character spacing at a higher speed, then increasing the inter-character and inter-word spacing to slow the sending speed down to the desired speed. For example, to send at 5 wpm with 13 wpm characters in Farnsworth method, the dits and intra-character spacing would be 92.3 milliseconds, the dash would be 276.9 milliseconds, the inter-character spacing would be 1.443 seconds and inter-word spacing would be 3.367 seconds.

** How do I modify my current Amateur license?
To modify your license (change of address, change of station location, change of name, renewal, or even change of callsign), submit an FCC Form 610 to the FCC. Forms are available from the FCC or ARRL or a local VE session or ham radio store. Do NOT use a photocopy. Check off the appropriate boxes, fill in the new/changed information, SIGN THE FORM, and attach a copy of your current license (or a brief letter of explanation for its absence, ie, "my dog ate it"). NOTE: If you check the box to change your callsign, YOU WILL GET A NEW CALLSIGN, even if all you wanted was to supply a new address; if you want to keep your callsign, DON'T CHECK THAT BOX. Send the form to FCC, POB 1020, Gettysburg, PA 17326. Turnaround time (for CURRENT licensees only) is about 2-4 weeks.

ANY ham can apply for a new callsign (this is different from the past where you can only get a new callsign if you move or upgrade). You can't specify WHICH ONE you want, a new one comes from the same pool as new licensees for that class of license. The callsign is based on your mailing address. For overseas military and civilians, be sure to

specify a station location that is within FCC jurisdiction.

New licenses are for 10-year terms. If you apply for renewal before its expiration date, the expired license is valid for 60 days after expiration to allow for the new license to arrive. You have up to 2 years after expiration (5 years for an old 5-year license) to renew before re-examination is required (but you can't operate with an expired license). You will lose your current callsign after 1 year after expiration if you don't renew.

** I'm confused about XXX, should I ask the FCC?
Whatever "XXX" is in this case, the overwhelming ARRL and net opinion is a resounding "NO!", at least not as a first step. Amateurs are generally very law-abiding people and have historically written the FCC asking for clarification on some operating practice or another. This is a very dangerous practice, for several reasons.

Most amateur radio regulations (contained in Part 97) are generally very loosely-worded, so as not to restrict experimentation and new techniques. But asking the FCC for a clarification will set in motion the process of "clarifying" it for everyone (i.e. new rulemaking.)

Examples of such restrictive rulings include varying topics like when Hams can help non-profit agencies or effectively forcing packet BBS sysops to screen messages before forwarding them. They were the result of well-intentioned questions by Hams that forced the FCC to make a ruling where they previously allowed the amateur radio community to police itself.

Under all circumstances, it is better to first read the rules yourself. Then, if there's a problem, ask your national amateur radio organization (such as the ARRL in the US) which can give qualified advice about interpretation of FCC regulations. Organizations like the ARRL also have the influence to ask the FCC informally, without forcing a ruling.

Even if asking the FCC doesn't result in a restrictive ruling, it is generally a good idea to not overburden an under-staffed and under-funded government agency with a lot of correspondence. The Amateur Radio Service has traditionally been a low-workload "hands-off" service, and has enjoyed a wide latitude from the FCC. Please don't ruin this image for your fellow amateurs.

Part 6 - Special Topics in Amateur Radio questions

Questions discussed in Part 6: (dates indicate last modification)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

** Is there any information on antique radios?
Antique radio classifieds: ARC, PO Box 802-B6, Carlisle, MA 01741 -
old radios, TVs, ham equipment, 40s and 50s radios,
telegraph, books, etc.
Hallicrafter Service manuals: Ardco Electronics, PO Box 95, Dept Q,
Berwyn, IL 60402
Antique Wireless Association, Bruce Kelley, W2ICE, Route 3, Holcomb,
NY 14469 - sponsors the Wireless Museum
See also the info on antique-radios mailing list in FAQ 2.

** Where can I buy vacuum tubes?
Kirby, 298 West Carmel Drive, Carmel, IN 46032 (1-317-843-2212)
Antique Electronic Supply, Box 1810, Tempe, AZ 85281 (1-602-894-9503)
Fair Radio Sales, Box 1105, Lima OH 45802
Fala Electronics, Box 1376-1 Milwaukee, WI 53201
Southern Radio Supply, 1909 Tulane Ave, New Orleans, LA 70112
(10504-524-2343)

** What do I need to get started in packet radio?
Packet radio is a digital form of communication using radios. There
are OTHER digital forms, as well, like CW, RTTY and AMTOR. To use
packet radio, you'll need a radio (2 meters and 70 centimeters are
most popular), a box that converts radio signals to digital signals
that a computer can understand (called a TNC or terminal node control-
ler) and a computer or terminal. For some computers or TNCs you may
need special software as well. However, most TNCs and computers get
along quite well with just a terminal emulator software package. Most
personal computers can be interfaced to use with packet radio. Since
there are many digipeaters, generally even an HT will work with
packet radio.

Your first source of information on Packet Radio should be the
rec.radio.amateur.packet newsgroup. It has its own regularly-posted
FAQ that goes into much more depth on the subject than this one can.
See also the mailing list and archives info in Part 3.

For more information on packet radio, you might try TAPR (Tucson
Amateur Packet Radio), PO Box 12925, Tucson, AZ 85732 (602-749-9479).

** What do I need to get started in satellite communications?
For more information about Amateur Satellite Communications, try
AMSAT (Radio Amateur Satellite Corporation), PO Box 27, Washington,
DC 20044 (301-589-6062). They also have an international net on
Sundays on 14.282 MHz at 1900Z.

** What is available to get started in ATV, SSTV and WEFAX?
This is a large subject area in itself. Amateur Television (ATV),
Slow-scan TV (SSTV), and Weather FAX (WEFAX) all deal with transmitted
pictures. (ATV includes moving pictures and audio just like your
household TV.)

Equipment is available to interface to most common microcomputers including PC clones, Amigas (which are prominent in most video applications anyway), Atari ST, and others. (At last check, we didn't see Macintosh on the list.) There are also a handful of publications on the subject.

All this information is available via FTP in the /pub/ham-radio directory at ftp.cs.buffalo.edu. (If you don't have Internet access, see Part 3 for instructions on the FTP mail server.) The file called sstv_wefax_info is maintained by John Langner WB2OSZ (johnl@avs.com).

Another resource is the regularly-posted UseNet Elmers Directory. The list contains a volunteer Elmer who can help with ATV, SSTV, and WEFAX questions.

** What are these contests I sometimes hear, and how do I participate?

Dozens of contests are held each year, usually at weekends, and can provide useful operating experience. They typically last for 24 or 48 hrs, and are usually on SSB or CW only (the Russian CQ-Mir contest is on both modes at the same time). You can participate by making one QSO or several thousands. In most contests you send a signal report (traditionally 59 or 599) followed by a number that is different for different contests - the most common one is a serial number (so you send 599 001 for your first QSO, then 599 002 etc). The exchange may, however, be your age (All Asian contests), your CQ or ITU zone (CQWW and IARU contests, respectively), your state (ARRL contests) or something else. Read "Contest Corral" in QST for the rules for all major contests - the more serious contester may wish to subscribe to the National Contest Journal, or join the e-mail contest mailing group (write to Trey, WN4KKN, at garlough@tgv.com). Knowing the rules can prevent embarrassment - you will get a cool reception if you are a W or VE and call a W/VE in the ARRL contests, since they can only work non-W/VE stations. Otherwise, QSOs made in contests are just as valid for DXCC (DX Century Club - more than 100 contacts), WAS (worked all states) and other awards as are 30-minute ragchews. Although not strictly a contest, the annual Field Day provides very useful operating experience under less than optimal conditions and is highly recommended for new operators - check with your local club for their Field Day plans some weeks before the (late June) event.

1946. FAQ - do you prefer the long form or the short form

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-09 15:46:43 UTC
From: brian@ucsd.edu
Message-ID: <163el3INNq7j@network.ucsd.edu>
Source record: 286030

I've reposted a copy of the periodic FAQ document that consists of all the parts (in order) in one large message.

It would be interesting to see if you get the long message vs whether you get all the part of the multipart one. It has been claimed that the multiple short parts are needed in order to assure propagation. This is a chance to see if that's true.

If no one forges a cancel message for it AGAIN, you might compare the long version with the multipart version and see which you prefer to get.

If you don't get the long one, Message-ID: <163doeINNpps@network.ucsd.edu> you might care to examine your news system's log to see if a cancel message was forged for it.

Nearly all of Usenet should be able to carry an article of this length. Certainly NNTP-connected sites can; most uucp sites should be able to do so as well.

If the FAQ article can be successfully transported in a single large posting, there is a net win in saved header bandwidth and user frustration with having to assemble the multiple parts - or skip the message they've already seen.

Note that the FAQ posting is not sent to the info-hams mail digest subscribers; they can retrieve the FAQ posting from the UCSD listserver.
- Brian

Source record: 286031

Since my previous post 1 or 2 people have advised me that, although they sympathized with my position, continuing arguments that aren't directly radio-related on this newsgroup is a sure way to get dismissed as a demagogue and a flame-monger.

In keeping with their advice, I will merely state for the record that I didn't cancel Brian's post (cancel wars don't do anyone any good), and that I have asked Brian to enter into a form of Usenet 3rd-party-arbitration on an expert forum outside of the amateur radio newsgroups, namely the faq-maintainers@mit.edu mailing list conducted by Jon Kamens at MIT.

This conflict has gone on far too long and I would like to see it resolved as quickly as possible.

We now return you to your regular Morris flame-war, already in progress.

1950. RACES Bulletin #234

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-09 19:49:50 UTC
From: enge@almaden.ibm.com
Message-ID: <9208091949.AA15617@ucsd.edu>
Source record: 286032

Msgid : $RACESBUL.234

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.234 DATE: Aug. 10, 1992
SUBJECT: MGT - Skills inventory by the Radio Officer

There are times that an inventory of RACES member skills can be helpful to the Radio Officer. Here are the skill codes we have developed for our communications volunteers in government service:

A Administration: supervision, management or administrative assistant
C Consultant, technician, engineer, installer, sysop or remote sysop
D Digital and/or computer, including disc preparation
F Field responder
G Go-fer, Messenger
H OES Headquarters operating experience
L Liaison, as with CAP, MARS, Highway Patrol, State Police, Forestry, others...
N Net Control Experience on HF
P Photographer
R Radio Officer
S Secretarial, clerical
T ATV and or related video skills
V VIP enrolled and trained in CDF VIP amateur radio unit
W Work party and/or tower climbing
Z Commercial type Drivers License

The data came from an enrollment form which lists interest areas ranging from 1 to 10. They are sorted on the computer into meaningful rosters. Letter designators are used as members have multiple skills or areas of interest. This assures the interests of each individual is met, as well as provides a quick reference. In a recent situation heavy-rig drivers were needed in the fire division of OES. A quick check of the RACES roster found three such drivers. Two were contacted, and assigned to the fire division. While that was not a radio operation, they filled a need that utilized their skills and were pleased to be called for their assignment. That this occurred was due to the interest and

skill of a RACES Coordinator who involves RACES members in any conceivable situation that their skills can be effectively utilized. While this may not be applicable to your situation, use it as an idea and create your own! ---Cary Mangum, W6WWW

EOM

RACES Bulletins are archived on the Internet at ucsd.edu in hamradio/races and can be retrieved using FTP.

KITSAT-A LAUNCH INFO: PART I

HR AMSAT NEWS SERVICE BULLETIN 221.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 21, 1992 BID:$ANS-221.01
TO ALL RADIO AMATEURS BT

More KITSAT-A/S80T/POSEIDON/TOPEX Launch Details: Part I

The 52nd Ariane launch is to place the TOPEX/POSEIDON satellite and two auxiliary payloads, KITSAT-A and S80/T, into a quasi-circular 66 degree inclined orbit using an Ariane 42P launch vehicle equipped with 2 solid strap-on boosters. This will be the 2nd launch of an Ariane 4 in the 42P configuration. It will be launched from the Ariane launch complex ELA 2, in Kourou, French Guiana.

The launch vehicle performance requirement is 2,661 kg (5,868 lb), of which 2,502 kg (5,517 lb) represent the satellite mass. The total vehicle mass at liftoff is 320,587 kg.

Required Orbit Characteristics:
Perigee Altitude ..... 1322 km
Apogee Altitude ..... 1330 km
Inclination ..... 66 degrees

The Ariane 42P lift-off for Flight 52 is scheduled on Monday August 10, 1992, as soon as possible within the following launch window:

Kourou Time GMT Washington, DC
20:08 - 20:53 23:08 - 23:53 19:08 - 19:53

Launch Vehicle: Ariane 42P.

This is a three-stage liquid fueled launcher with solid fueled strap-on boosters. The first stage (L220) is built by Aerospatiale, and is powered by 4 liquid fueled Viking V engines. The second stage (L33) is built by MBB Erno and is powered by a single Viking IV engine. Both the Viking IV and V engines are manufactured by SEP. The first and second stages use a biliquid UH25/N2O4 fuel. The third stage (H10) is built by Aerospatiale, and is powered by a cryogenic LH2/LO2 fueled HM-7B engine built by SEP. The two strap-on boosters (PAP) are built by BPD and use a solid Flexadrine propellant. The fully assembled launch vehicle stands 55.2 meters high on the pad. It uses the Ariane Type 2 payload fairing.

Flight Profile:

+01:29 Solid strap-on booster jettison
+03:24 First stage separation

+03:48 Fairing jettison
+05:35 Second stage separation
+17:37 Third stage shutdown / orbit injection
+19:29 TOPEX/POSEIDON separation
+23:36 KITSAT-A and S80/T separation
+27:46 End of Ariane mission 52

Payloads:

TOPEX/POSEIDON is a cooperative program between NASA and CNES for studying the ocean surface topography. The satellite is built by FAIRCHILD SPACE under contract to NASA/JPL. For 3 to 5 years the altimeter payload will survey the ocean circulation on a global scale.

Total mass at lift-off .... 2,402 kg
Dry mass ..... 2,185 kg
On-board power ..... 2,140 W (end of life)
Solar panel span ..... 8.7 m
Orbital altitude ..... 1336 km

[The AMSAT News Service (ANS) would like to thank Mr. Dean Adams for the this bulletin item.]

HR AMSAT NEWS SERVICE BULLETIN 221.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 21, 1992 BID:$ANS-221.02
TO ALL RADIO AMATEURS BT

More KITSAT-A/S80T/POSEIDON/TOPEX Launch Details: Part II

Auxiliary Payloads:

KITSAT-A uses the UOSAT platform built at University of Surrey (UK) for the Korean Advanced Institute of Science and Technology. It will be used for store and forward communications and various experiments.

Mass ..... 50 kg
On-board power ..... 21 W (end of life)
Nominal lifetime ..... 5 years
Satellite is 0.35 x 0.35m in size, with a 6m deployable mast

Instruments:
Two CCD cameras with 4 km and 400 meter resolution
Digital signal processing experiment
Transponder for store and forward communications
In-orbit radiation measurement experiment

S80/T is built by MATRA MARCONI SPACE for CNES, also using a platform of the UOSAT type. It will be used to study use of the VHF band for mobile communications.

Mass ..... 50 kg
On-board power ..... 26 W
Nominal lifetime ..... 1 year
Satellite is 0.35 x 0.35m in size, with a 6m deployable mast

Payload:
1 transponder- 148-149.9 mhz reception
137-138.0 mhz transmission

Launch coverage:

All Ariane missions are broadcast live via satellite from Kourou. Coverage begins at 30 minutes before launch, and continues until all payloads have been deployed. NASA Select-TV will also broadcast this mission on SBS-6, transponder 6.

Preliminary Keplerian Elements:

Satellite: KITSAT-A KITSAT-A FREQUENCIES

AMSAT-NA SPACE SYMPOSIUM UPDATE

HR AMSAT NEWS SERVICE BULLETIN 221.03 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 21, 1992 BID: $ANS-221.03
TO ALL RADIO AMATEURS BT

AMSAT-NA Space Symposium & Annual Meeting Set For Oct 9-11th

AMSAT-NA officials are very excited about the "line-up" of the many outstanding speakers who will be presenting papers at this year's AMSAT-NA Space Symposium and Annual Meeting. This year's Space Symposium will be held in Washington, D.C. on the weekend of October 9-11th at the headquarters of the INTELSAT Corp. The scope of the papers being prepared for this Symposium is quite remarkable -- topics range from "Getting Started" by Mike Crisler to several papers dealing with Phase-3D by Dick Jansson and many others. Ron Broadbent from AMSAT-UK will be present to discuss OSCAR operations from the "European Users Perspective." So far, a total of 24 speakers are prepared to present papers during the 3 day Symposium.

Symposium planners are very excited because they know as time gets closer to the deadline there will be even more speakers turning in their papers. All this makes for an excellent Space Symposium. Symposium planners urge everyone who is thinking about attending NOT TO PROCRASTINATE about sending in your registration forms. If you would like a registration form, please contact AMSAT-NA Headquarters at (301) 589-6062. Once you send in your registration form you will receive a "packet" of information about the most convenient hotels near the INTELSAT Headquarters and a map and directions on the best way to get there. So don't dely -- join us this year for the ninth AMSAT-NA Space Symposium and Annual Meeting.

AMSAT OPERATIONS NET SCHEDS

HR AMSAT NEWS SERVICE BULLETIN 221.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 21, 1992 BID: $ANS-221.04
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and Mode J/L on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

15-Aug-92 1300 B 105 WB6LLO W9ODI
22-Aug-92 1435 J 55 WA5ZIB WJ9F
29-Aug-92 1900 B 72 W9ODI N7NQM

Guest commentators are planned. Join the Net if you have questions.
In the unlikely event that either the Net Control Station or the alternate do not call on frequency, any participant is invited to act as NCS.

Slow Scan Television on AO-13

SSTV planning sessions will follow the AMSAT Operations Nets.
Fall scheduling will require input from all interested operators.
Try all AMSAT Nets for impromptu schedules.

>I've reposted a copy of the periodic FAQ document that consists of all the
>parts (in order) in one large message.

Why are you taking it upon yourself to customize someones posting??? The
people in charge of posting the FAQ should be the ones combining it as one
if there is good reason. If you don't like the way they post it you should
tell them, and if they don't agree, then too bad.

Really, it's pretty simple for an individual to combine the part on their
own. I don't see why you need to do this for them.

>It would be interesting to see if you get the long message vs

>...(some deleted)
>
>Nearly all of Usenet should be able to carry an article of this length.
>Certainly NNTP-connected sites can; most uucp sites should be able to do
>so as well.

There is more involved then propagation on the net. When I go to download
the FAQ to my PC at 2400 baud I like it in the multipart form, and this
may be a concern for some of the SLIP connects too. If the communication
link drops for some reason (wife or kids pick up the other phone) while it
is being downloaded, it gets aborted and I have to start all over. So, I
don't loose as much time restarting the download when I do it in parts, I
only have to restart the part that was interrupted.

>If the FAQ article can be successfully transported in a single large
>posting, there is a net win in saved header bandwidth and user frustration
>with having to assemble the multiple parts - or skip the message they've
>already seen.

Header bandwidth is pretty small, this isn't much of an argument. And it's
not hard for anyone with minimal knowledge of newsreaders to assemble the
parts, the news reader will do it for you.

>Note that the FAQ posting is not sent to the info-hams mail digest
>subscribers; they can retrieve the FAQ posting from the UCSD listserver.

If you want to provided the FAQ parts in assembled form for YOUR listserver
then fine and dandy. Since you manage the UCSD listserver you are well
within your rights to do what you want.

Innocent bystander's $0.02 worth,

1956. Gamma vs. T match

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-09 23:42:14 UTC
From: goris@hpfcso.FC.HP.COM
Message-ID: <103360107@hpfcso.FC.HP.COM>
Source record: 286045

Gamma vs. T match.

As everyone knows, there are dozens of ways to match transmission lines to antennas. My questions concerns the tradeoffs between a Gamma match and a T-match (with coax delay line). I have a 7-element 2M beam (V pol.), and hook RG-8X to it. I'm currently using a gamma match, and it works pretty well (everything's home built). At a recent antenna testing session, a bunch of the EME-'gurus' said that 'gamma matches don't work', and that you should really use a T match. Well, I don't know if I'ld go so far as to say they don't work, since mine works fine, but I am wondering if a T would work better. I've read everything in the ARRL antenna handbook, and while they describe a plethora of matching techniques, they don't really say anything about one having better balance than the others.

Can anyone comment on whether a T-match will give me that much better results than a Gamma? Since the antenna is vertically polarized, I don't want all my energy going into space or the ground. Has anyone done any experiments? If there's any EME guru's in net-land, feel free to pile your knowledge on top of what the other EME guys already said.

Thanks, ANdy GOris AA0CM goris@fc.hp.com

1957. HF Packet Survey...

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-10 00:42:55 UTC
From: enge@almaden.ibm.com
Message-ID: <9208100042.AA29541@ucsd.edu>
Source record: 286038

The HF packet survey data was solicited in QST and the RTTY Journal.
But some questions remain:
1) Which packet magazines were covered?
2) Was there an ARRL bulletin soliciting data for the survey?

If the answers are NONE and NO, I am disappointed at someone
attempting to say that the survey represented any sort of
cross-section of the amateur community,

Roy, AA4RE

1958. Lan-Link 2.0

Newsgroup: rec.radio.amateur.misc

1960. Icom IC-229H Mods

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-10 03:54:00 UTC
From: bo@yenta.alb.nm.us
Message-ID: <1992Aug10.035400.1883@yenta.alb.nm.us>
Source record: 286046

I just purchased an Icom IC-229H mobile Transceiver. I am now looking for mods to extend the receive and transmit range.... any help would be appreciated.
Bo Farley bo@yenta.alb.nm.us

1961. Kenwood TM-741 mobile rig - INFO WANTED

Newsgroup: rec.radio.amateur.misc

Source record: 286070

>I have a friend who has a Kenwood TM-741 mobile rig and got the
>optional
>tone board for it. The question is, how to get the microphone DTMF
>pad
>to allow direct frequency entry and/or whatever else the tone board
>allows
>you to do through the microphone keypad. Any info would be greatly
>appreciated.

Nothing. The DTMF board is for decoding of DTMF from the receiver to open
squelch ... it allows you to monitor a frequency and not have the squelch
open until a certain sequence of DTMF comes across.

cchapman@matd.gatech.edu (Charles H. Chapman) proclaims:

>Morris is an intentionally deragatory term used by hams who are unable
>or unwilling to learn Morse code or improve their Morse code skills.

>Chuck

It's not. It is also used affectionately by some of us who like CW
and use it most of the time on the air, at speeds an order of magnitude
higher than that required for the beginning ham license.

It's actually a term used by those who don't take life too seriously,
and it would probably be used less if those who take life too seriously
didn't object to it every time one of the former people uses it in polite
company.

1964. Mobile Dual Banders

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-10 04:23:31 UTC
From: sdkuo@vela.acs.oakland.edu
Message-ID: <1992Aug10.042331.23921@vela.acs.oakland.edu>
Source record: 286042

I'm thinking of purchasing a mobile dual bander. Specifically the Icom 2410. My question is, what does a standard 2410 do or not do? I notice that DTMF and tone squelch are extra. There is also an optional voice synthesizer, what does this do? Will a standard 2410 act as a remote cross band repeater (like the Alinco DR-590T), or is this an option? I also noticed that there is an orange on black and black on orange displays. Which looks sharper and functions better in different lighting conditions. Any feedback on the 2410 and other dual banders (like the Alinco DR-599/590, Icom 2400/3200, and Yeasu 5200) would be appreciated. Please respond by Email or Email/Post. One last note, I'm looking for wide band receive and good out of band receive (like air and 800MHz) too.

Thanks in advance,

Steve Kuo, N8OPH, sdkuo@argo.acs.oakland.edu

I received following message from Shima (JQ3EEL/V63SM) about his
operation from Pohnpei.
Please look for him at V6 land.

SB DXNEWS@ASIA
MICRONESIA DX QRV

It is our intention to operate from Micronesia, Pohnpei Isl. in Sep 1992
mostly on 15meter band, both SSB and CW.
At least 2 stations (V63SM + one) will operate.
We will stay there from 4th of Sep. until 10th.
We'll take a part in the All-Asian-DX-Phone contest.
During the contest, we work for JA's. But we'll look for North Americans and
Europeans before and after the contest.

We have also plan to be on 6m (50.130). Please watch carefully!!

For detail, please send me a electric mail by CompuServe [101110,325].

Well you can't blame the league entirely for your friends going inactive.
The only way things are going to progress is for people to "just do it"
instead of waiting for George to do it. That's a pervasive attitude in
today's society, not just at the League. People gripe, but they don't
act on their gripes. They expect Uncle Sap, or in this case Cousin Hiram,
to fix everything in thirty minutes, less commercials. The world doesn't
work that way.

>a matter of watching for them. Does 10 meter activity decline at the
>bottom of the cycle? Yep. Is the band utterly dead? Not by a long shot!

Well don't misunderstand me, I've done a lot of transequatorial work
on 10 in late summer at the bottom of the cycle too. What I was trying
to say is that when the band is dead, it's really dead. And when it's
hot, almost anything works. 10 is not a good band for judging the
effectiveness of antennas, unless you can A B them in real time. A
band where you can set your watch by the propagation is much better,
say 160 meters.

1968. Re: Differences between IC-W2A DJ-580 FT-470 TH78A

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-10 05:41:55 UTC
From: jab0684@usl.edu
Message-ID: <1992Aug10.054155.10174@usl.edu>
Source record: 286066

Well John, In regards to your query, the Alinco DJ580t does NOT offer
alpha-numberic paging. It does however have dsq paging. THis means
that it can display a 2 digit number as a message. Also, the digital
squelch lets you set a group 3 digit number and a personal 3 digit
number. Depending on the mode you select, your audio will open up
for the group, the personal or either.
A few specs on the unit:
receive: 130-174 FM
108-142 AM(*)
400-519 FM
810-998 FM(*)

transmit: 144-148 FM
440-450 FM

VFO's: dual one for vhf(108-174 mhz) another for (400-519 and 810-998mhz)
you can listen to both or one VFO at a time.

memory: 20 channels for vhf and uhf. each band also has 2 channels for
programmed scanning. I addition each band has 1 channel to be
accessed by the 'call' button. 3 phone numbers may also be
stored for use by the autodialer. lasty 3 DSQ messages may
be kept in memory.

tones: encode/decode standard w/tone squelch

scanning: 3 scanning modes: timed scan, busy scan and programed scan(
from one frequency range to another) also memorized
channels may be added and removed from scanning w/the skip
button
dual watch function has two modes, can assign priority
to one mem. channel over another in the same vfo.

tuning: user varible khz intervals using the 'step' function
pressing function key while tuning increases by 1 mhz steps.
for repeater splits only 1 shift amount may be entered per
band(default is .6 mhz for vhf, and 5.0 mhz for uhf). + or
- may be selected for each mem channel. in case of a nonstandard
split, the split may be entered into VFO but not saved in mem.

additional features: full backlit keypad, and display, dual squelch and
volume controls.

*access to these receive frequencies requires the 'airband modification'
listed in the users manual. You simply unsrew the 4 battery plate screws
(REAL small screws) and cut a red wire. This allows you to tune
AM airband(108-142 mhz) and 800 mhz (800-999 mhz) including cellular

phone frequencies. (note that the book mentions nothing about the extra
uhf capabilites enabled by doing this modification)

Specific dislikes:

The backlighting function, thought it works well, only stays lit as long
as you push a button or turn a dial(it goes off after about 5 seconds).
I wish I could make it stay on when I wanted to.
Also, access to the "V.U.SP" jack is hampered by the rubber 'stopper'
when it is removed, because the stopper is attached to the antenna connector
and does not rotate to the side. Thus you have to bend the stopper
sharply upward to use this jack(vusp jack provides stereo output w/vhf in right speaker,
and uhf in left)

Although I've never had any problems with it, the "battery lock clip",
a small piece of metal on the battery plate, seems too little. I worry
that due to it's small size, this tiny piece of metal my wear out,
and break from the bending of removing/sliding on batteries.

The metal belt clip on back serves as a heat sink. If you run this radio
at fives watts for a couple of minutes or so, you'll be tossing it from
hand to hand like a hot potatoe. Although I understand this is a problem with most ht's

Specific Likes:

I really like the dual band monitoring cability, as well as the radios
very comapact size. It's as small as any dualbander around.
The price $399 from ham radio outlet seemed resonable. The
Alinco 2 year warranty is also impressive to me. This HT's extented
recive coverage seems second to none. I like the fact the all jacks
come with plugs or stoppers to keep out trash. Plenty of memory
channels. I like the fact the all digits in the freq. display are
full sized, I dislike radios w/ 2 small numbers and one big one.
The standard battery is a 7.2 volt 700 mah unit, and comes w/charger.
The radio has 2 watts out w/std batt. 5 watts w/opt. batt., 5 watts
when operated from 13.8 volts or car.
Alought I've yet to use it, the built in cross band repeat function
seems neat.

Overall:

Since I'm a new ham(only 2 months on the air), and this is my first
radio I've owned, weigh may opinions accordingly. Anyone seeking
to buy a radio would be well advised to seek more experienced counsel.
I really like this radio, and feel I got a good value.
I would buy this radio again, and if there is a mobile/car unit
in my future, It will probably come from Alinco as well.
Lastly in terms of transmitting to and recieving the local repeater, it
seems to do as well as other 2 watt ht's also equipped w/stock
rubber duck antennas.

>
>Me too.

Me too too. :-) But seriously folks, Tom and Jerry were great in Poptronics.
If we can have cute stories that lead into real meat, that's not so bad.
The current series actually brought up some good points about public
service operating in a painless manner. I agree that a little goes a
long way, but a little is ok if it's done well. Look at Steve Cicara's
columns in the old Byte, interesting yarns that lead into real technical
material. It was the first thing I read when the magazine came.

>>Now, I'm an engineer, so I realize that I may have more technical
>>interest than the average ham. But there are other types of non-technical
>>stories that could be run. How about tutorials on operating DX or

>that information already in print there, but it's covered in far more
>detail than QST space would allow. If we have to republish tutorials
>on every aspect of ham radio every few years, we'll *never* have room
>for new stuff.

I agree with this 100%, beating a dead horse for the umteenth time is
bbbbooooorrrrriiiinnnngggg. QST should expand it's resource directory,
however, to point to where this material can be found. A brief box pointing
to other resources should be a part of every issue of QST.

QST's indexing system isn't great either. I'd like to see the League
offer an *electronic* index system that would allow meaningful keyword
searches, and a reprint service that's fairly fast and easy to use.

>I used to think that the QST technical level should be considerably
>higher than it is. To a degree, I've become convinced otherwise. The
>vast majority of hams are not engineers and cannot be expected to
>understand highly technical material. They are tinkerers, to the

>ground-breaking technical stuff, if for no other reason than to provide
>visibility to such work. And QST should publish overview articles
>that contain enough detail to let the technically inclined know
>whether they want to delve deeper.

Highly technical material can be presented in ways where reams of
equations and dry text aren't involved. I'd point you to Communications
Quarterly for good examples. The material is highly technical, but still
mostly accessable to the layman. Their article on traveling wave amplifiers
was particularly good. *Some* math is often essential, and should be
presented and explained clearly. This *is* a technical hobby after all,
we should expect amateurs to not be mathphobic. Walt Maxwell's _Reflections_
is a good example of a technical topic where the math is introduced and
explained clearly enough that an interested layman can apply it properly.
What we don't want is a "assume gooblygook, thus more gooblygook QED!"
Author's have to work through an example, show units, attribute physical
relevence, etc before equations are meaningful to the interested layman.

>One new thing we are doing for the first time in September is publishing
>companion articles in QST and QEX. We have an article on a neat DSP

>article gives some fairly low-level technical explanation but
>concentrates, as QST articles do, on building and using the thing.
>The QEX article explains the algorithms used and shows the results of a
>number of computer simulations of the algorithm. Depending on how well
>this is received, perhaps we can do more of this sort of thing in the
>future.

I don't like this idea. It's hard enough to track down one article,
let alone two in two different publications. QEX shouldn't be a sidebar,
that should be physically with the companion article. If QEX can't
succeed as a standalone publication, it should be folded back into
QST. I hope it *can* survive as a standalone publication, but I won't
accept it as an appendix.

>that there are already books with more advanced circuits in them.

I disagree. All but one of the magazines cater to the newbie "one evening kit" mentality *now*. There are books with cookbook circuits in them, but that's not what the semi-pro needs to enhance his skills. What's needed, and not well serviced by books or magazines, are hands on articles explaining how to *design* and build circuits. Most QST tech articles are cookbook articles telling you how to *build* a project, but there is very very little material in QST or other League publications aimed at other than rank beginners on the subject of how to *design* circuits. Most amateurs never learn that skill because no one is teaching it. Analog RF design is a rather arcane skill, but one that amateur *radio* enthusiasts should learn. Digital projects are fine, but the sloppyness that can be tolerated in a circuit that is always either on or off won't cut it in a linear analog circuit.

In the good(?) old days, there were articles on load lines and bias points, on interstage matching methods, on calculating drive requirements, etc. Today we are lucky to get a cookbook article on a transmatch, much less using S parameters to design an unconditionally stable amplifier. Or even an article explaining what the hell S parameters *mean* in terms the average amateur can understand.

The RSGB, Japanese, and German publications are somewhat better, and the League does have the outdated Solid State Design book, but more needs to be done for the vast majority of amateurs who *aren't* newbies and *aren't* professional engineers, but who would like to enhance their knowledge of RF electronics. Self training is a fine concept, but most amateurs are being left *completely* by themselves in this middle ground. A little guidance and help is required to advance from newbie to expert.

1972. Dualband HT recommendations?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-10 06:42:37 UTC
From: mju@mudos.ann-arbor.mi.us
Message-ID: <Bsr9B2.31o@mudos.ann-arbor.mi.us>
Source record: 286048

I'm a new ham (just passed my Technician exam this past Saturday), and I'm looking at getting a HT as my first rig. I'd like to get something that does 2m, for obvious reasons. Since it's not that much more expensive, I'm also looking at the dualband HTs, both 2m/222 and 2m/440. Some questions:

1. Everybody I talk to has lots of good things to say about Icom. Are there other brands I should be considering? I've heard of both Kenwood and Alinco, but know almost nothing about them (quality, features, durability, etc.). Any brands I should stay away from? Any specific model recommendations or warnings?

2. Generally speaking, is there more activity on 222MHz or 440MHz? Anybody know what things look like, band-wise, in the Ann Arbor/Detroit Michigan area?

3. What do the prices generally look like? How much should I expect to pay for, say, a used IC-24AT?

1973. Re: Differences between IC-W2A DJ-580 FT-470 TH78A

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-10 10:18:48 UTC
From: dakujak@wiliki.eng.hawaii.edu
Message-ID: <1992Aug10.101848.7900@news.Hawaii.Edu>
Source record: 286053

Basically, the W2A is the 24AT with the ability to receive both bands
at the same time. The FT-470 was the first radio to have this feature.
The DJ-580 has basically the same features as the W2A. To elaborate
they have ctcss encode, DTMF paging, cross-band repeat (after modification
for the 580), very wide band reception (after mods), etc..
Things to consider:
Icom's 12v (5 Watt) battery pack is rated for less than 400 mAH and
lists for $99.00. All toher manufacturers have cheaper paccks
with a greater capacity and are usually cheaper.
The Alinco has 40 memory channels which can be used either for VHF or
UHF. Icom's W2A has 30 channels for each band.
The W2A's battery pack has been known to crack at the rails when the
radio is dropped (although I believe Icom replaces it under warrenty, part
of Icom's famed customer support).
Icom's radios do not have a lighted keypad which makes its use in
the dark difficult. The layout of the W2A's keypad is a little "different"
making it harder to figure out in the dark.
Yaesu's FT-470 does not have extended receive coverage in the 800 MHz
range after any mod.
The Kenwood TH-78A is the most interesting radio of the bunch (in my
opinion). Kenwood claims it to be the smallest dual-bander in the world.
It uses an internal, sliding battery pack. It also has a keypad cover which
slides down and away for keypad use. The TH-78A has 50 memory channels,
although when you start to use the alpha-numeric memory, the number of
available channels start to decrease. A memory expansion unit is available
for about $24.00 which gives a maximum of 250 channels. From now to the end
of September (?), Kenwood is giving away a free SMC-33 microphone with the
purchace of the TH-78A, TH-28A, or the TH-48A. The SMC-33 lists for about
$50.00 and is a remote control speaker-mic. The Kenwood has a battery
indicator which roughly tells the battery's status during transmitting.
The FT-470 MAY have CTCSS decode ability (as well as encode), the
W2A does not have that feature, I am not sure on the other radios.
Looking at the Alinco DJ-580's brocure, I do not see a case for the
radio equipped with the larger 12V battery pack. Will they make one
available?
Alinco and Yaesu have much cheaper accessories than Kenwood and Icom.
Example: 12V battery packs ~$65.00 for Alinco and Yaesu, ~$90.00 for Kenwood,
and ~$100.00 for Icom's low-mAH rated packs.
If I had the money, I would buy the Kenwood. The Alinco is the best
bargain (price vs. features). Icom is noted for their customer service, very
quick turn-around time for repairs. While the FT-470 has just been around too
long.
BTW the W2A has been out for a while (over a year) I won't be
surprised to hear that Icom will have a new dual-bander out that outdoes the

W2A (and the 580) in features (like the Kenwood).

1974. Warning: Not-so-linear Amplifiers

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-10 13:37:33 UTC

Source record: 285987

I had the opportunity to pick up a couple solid state HF amplifiers (50W and 100W class) recently - you know, the kind "Designed Primarily for 10m Amateur Operation". One was single ended and the other a push-pull design and both appeared to be reasonably well made and laid out (different manufacturers). You can imagine my amazement when I put these things on a scope and discovered they were biased for CLASS "C" OPERATION! The manufacturer of the push-pull unit went so far as to provide locations for the bias components, and then strap them out with wires! Harmonic filtering on both units was limited to a pair of capacitors on the output coil of the ferrite transformer.

If this is representative of the market, it's no wonder "CB" amplifiers have earned such a bad reputation. Anyone sending a clean AM/SSB signal into one of these things can expect distortion, bad splatter and big harmonics.

What these can be are good building blocks for other projects -if you can properly finish them off. However, if you were just planning to put one on your new 10 meter mobile, steer clear - these amplifiers are bad news.

- Ken WB0QNA

Your local paper probably does a poorer job on other things than QST does.
There might be a reason for this. Try thinking about what it might be instead
of reflexively raving AGAIN about the ARRL committing crimes against humanity,
OK?

If you feel a personal need to know these people's names and addresses, phone
up the FCC and ask them; if you are certain that the vast majority of hams
feel that burning need, start up a newsletter. Don't be too terribly
disappointed, however, if *I* don't rush my check off right away, because I
personally have other priorities for my reading time than finding out the
names, ranks, serial numbers, and favorite soft drink of radio pirates.

I saw this last year, and it certainly had its desired effect on me!

It made me really angry at the shabby treatment Howard Armstrong received
from the twisted legal system and by manipulation of the FCC by Sarnoff.

On a side note ... Was Armstrong's original paper on FM published in
proc. of the IRE? Does someone have a reference?

E.O.A. claimed that Armstrong invented the Superhet, but I grew up
believing that a French inventor (who's name escapes me) was responsible.
Does any one know the real story?

Antenna Modeling Program - YAGIMAX ver 2.1 Shareware Product

I received a shareware copy of Yagimax from the author about a year ago. It was a PC based (clone or otherwise) software package. The package fits onto one 5 1/4 disk. The disk contains the Yagimax.exe, Install program, Gamma Match calc program, Taper correction program, and several data files (actual models!).

I copied the files from my A: to C: Run the install program 'YMINST.EXE' and answer the video type and color selections you prefer. Instructions are included on the disk - some form of READ.ME or YAGIMAX.DOC...

Running the program. The opening window (not a windows or X product), allows for the selection of creating a new model or load an old one. Selecting LOAD will present a window of existing antenna files. Arrow down to your selection and depress enter. The dimensional data (length, width, spacing...) is displayed. DOS limitations allow short filenames - so be brief. NBS3217.INP would correspond to the NBS model at 3.2 wavelengths, 17 elements. Other filenames follow suit.

The program is very easy to follow, and moving around is simple. It provides gain, F/B, SWR, and feed point impedances over selected frequency start/end points. You can maximize gain or F/B by element lengths or element placement. Assuming similar element construction, the balance point (CG) is computed and displayed. Polar plots, Smith Charts, Graphs, etc and be displayed. Stacking and height above ground results also computed.

I entered the NBS model for 3.2 Lambda 17 elements for 144 Mhz. The NBS and the Yagimax model numbers are in agreement !! My feed point numbers were 25 -20j (as an example) at 144.200. These numbers are entered into the GAMMA match program, assuming a gamma feed system, and the program computes gamma dimensions. At 144, no TAPER corrections are needed, but corrections for boom effects are computed by the TAPER program.

In summary, a simple and easy program to use. For HF work, 3 to 5 elements run quickly on my 286-12MHz VGA clone. 22 element VHF/UHF models took forever. Since then, I have upgraded to a 386 at 40 MHZ with 64k cache. Now it flies !!!! Yagimax also looks for a math co-processor.

PITFALLS: Don't get caught in the deadly spiral !!! Especially with simple 3 element designs. Antennas should exhibit smooth gain and swr

figures. F/B changes quickly - as expected. DO NOT try to squeeze
the last .00001 dB out of the antenna !!!!! Models will allow a 100 dB
gain with 40+ dB F/B for one frequency - but tuning 1 kHz will result
in a 500 dB loss in gain and 300 dB loss in F/B and an increase
of 100:1 in SWR! It does not exist !! Don't fall for it!!!
Play it safe. Use one of the NBS (your tax dollars) models in the ARRL
handbook as a starting point and 'touch-up' with modeling from there.

73, and good luck. Al NW2M Rockville, MD (301)294-8621

Ahem....

Technically speaking, the short stub is a series matching section
consisting of 1/4 wave of parallel transmission line formed by the
stub's proximity to the bottom of the 3/4 length main element.

There is no 'director', except in the movies :-)

> there other brands I should be considering? I've heard of both
> Kenwood and Alinco, but know almost nothing about them (quality,
> features, durability, etc.). Any brands I should stay away from? Any
> specific model recommendations or warnings?

You forgot hte Yaesu FT470. Mine's been pretty durable and I abuse it. The older ICOM (32AT style) radios were much more durable, but the newer 24AT/W2A are just as cheasy as the rest. At least when I drop the Yaesu it doesn't break the battery rails on the radio. (It did snap the catch but this part runs between free and 3 for $5.00 depending on how you ask for it).

> 2. Generally speaking, is there more activity on 222MHz or 440MHz?
> Anybody know what things look like, band-wise, in the Ann
> Arbor/Detroit Michigan area?

I would expect that 220 is dying (if it ever was alive) most places other than California. It's never been that popular and now that the lower 2 went away, it's tainted. Also as a result there aren't a whole lot of 220 radios out there and a that also contributes to it's unpopularity. 440 popularity is a very regional thing. In NJ 440 was very popular, down here in DC, it's hardly used (not that there aren't repeaters, there are all sorts coordinated, it's just that they are quiet most of the time). We use ours for shuttle retransmissions.

> 3. What do the prices generally look like? How much should I expect
> to pay for, say, a used IC-24AT?

You can get the 24AT and the FT470 for under $400 NEW now. Used, I don't know. You might be able to pick up a 24AT from a "gotta have the latest" type ham who whats a W2A.

>
>Thanks again Lloyd,
>--
>Mont Pierce
>

Thank you Mont, however, I'm pleased to announce that recent orders of
the callsign database have allowed us to passed the break even mark!

The Summer '92 Callsign Project is now a success! Whew!

For a while there, it looked very gloomy, but now that the data is
actually available, people are starting to come out of the woodwork to
order it. Orders are now being processed smoothly, with the best
turnaround time for QIC-24/QIC-150 tapes sent via US-MAIL!

If anyone wants to make a smaller donation in lieu of receiving a
tape, please pass that donation to the nearest callsign server instead
of to me. I am not affiliated with any of the internet callsign
servers, so they need your help directly. If you're a regular user
of an internet callsign server, then an appropriate donation of
around $2 would be in order.

Many thanks to all who have participated in the project.

I'm still making tapes for all those interested, just drop me e-mail
if you want info.

Thanks,

-fred

Radio Shack sells a clip-on antenna bracket which will fit on an external
pack frame or on the rear carrier of a mountain bike. I took an unused
mag-mount antenna, removed the mag mount and put the antenna on the RS bracket.
It hasn't experienced really bad conditions yet, but has survived daily
commuting over gravel roads with no problems.

I must agree that I also cringe when I hear the "destinated" term. The
term originated out of necessity, because, there is no gramatically
correct substitute for the word.

There are a great many words in the English language which originated
this way. Although it's poor usage by gramatic standards, it is
nonetheless completely understood and totally effective.

In other words, it may sound "bad" but it's intuitively understood,
and it fits in a place where no "real" word does.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 073 (OPDX.073)
August 10, 1992 (uploaded to KB2XL by KE2LJ)
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, DXNL, DF4RD, WB3LHD, The DX Bulletin, JH1FDP, K4CEF & Southeastern Cluster Group, KN4ZT, KP4BJD, N6MZ, K6PBT, NZ7E, N8AC, K8QWY, KF8VW, K8YSE, UB4WZA, VE3CDX and VE3ICR for the following DX information.

3B8CF QSL ROUTE. Mel, KN4ZT, has informed OPDX that Jacky's, 3B8CF, QSL route is being published wrong in some ham radio publications. They are listing DJ5RT as the QSL Manager which is wrong. Jacky states he has never used a QSL Manager and all cards should be routed via the Call Book Address (CBA).

7X, ALGERIA. Two stations have been quite active from here, 7X4AN and 7X2DG. 7X4AN can usually be found on CW in the 20 meter band around 0000 to 0200z. QSL to DJ2BW. 7X2DG has been heard on 18120 kHz around 1300z and 21265 around 1430z.

9A, CROATIA. Andreas, DL4MEH, and Heinz, DL9JH, will be active from Rab Island (EU-136) until the end of the month. There was a report of a station signing 9A4AA/P on IOTA EU-136 (Aug. 6 on 14260 kHz at 2000z), but OPDX is not sure if this is the same group. We will update you.

9L, SIERRA LEONE. Jerry, WD5HFK, was active from 9L-land on 15 meters around 1930z and on 20 meters around 14170 kHz at 2330z. He is using the callsign 9L1JC. Jerry works at the U.S. Embassy and offered the following explanation regarding amateur operations in Sierra Leone: The information previously published regarding the elimination of amateur radio activity from Sierra Leone is true. However, an exception has been made for the U.S. Embassy station and it is expected that this exception will be extented to other diplomats. It is also expected that missionaries in the country will also be allowed to operate as well. Jerry will be leaving September 1, 1992, but his replacement is expected to get a license and hopefully will operate. QSL 9L1JC to: Jerry Cooper, 211 Meadowlake Dr., Seguin, TX 78155. The 1992 CallBook address is wrong.

ARCTIC ISLANDS DXPEDITION. Geo, UY5XE, and Vic, UB5LGM, have put off their DXpedition to /4K4A, 4K4P and 4K4N until September. Transportation and financial problems are to blame.

EA9, CEUTA and MELILLA. A group of 13 operators from Spain should be active this week from Alhucemas Island (AF-061). Look for them signing as AN9A or EG9A. QSL via EA4KK.

EI, IRELAND. The special callsign of EJ6O will be used to activate Clare Island (EU-121) from August 8-15. QSL via EI2CA.

EP, IRAN. By the time you read this, Romeo (1S0RR, 3W3RR, UB5JRR, XY0RR, YA0RR, etc.) should be on the air from Iran. Callsign is unknown at this time. He plans to be active on both SSB and CW with the possibility of RTTY. Operations will be on all bands including the WARC bands. QSLs will be handled by Ed, NT2X. UPDATE 8/9: Just before going to print, Romeo showed up signing 9D0RR. It seems Romeo left Russia Saturday night for Terhan and has his FT990 with him. There are two operators presently active. They were heard on 21295, 18083 and 18132 kHz. They will be there until August 16th. Romeo will be returning to Moscow to put R3A on the air August 19, in celebration of the one year anniversary of Russian independence.

FO0CI QSL CARDS. It was reported on the 14256 DX net by Pete, N0AFW, that he has mailed out 10,000 FO0CI cards on August 3, but has 5,000 more cards to go. A total of 30,000 to 35,000 cards have been sent out already.

FR/E/G/J, INDIAN OCEAN DXPEDITION. It was reported that the TDXB states Jack, FR5ZU, will be operating from Glorioso /G, Europa /E and Juan de Nova /J during September.

HAMS IN SPACE. A SOYUS spacecraft lifted off this week with three cosmonauts heading towards the Russia spacecraft MIR. On board are French cosmonaut Michel Tognini, F6MIR, and two Russian cosmonauts, Anatoly Solovyov, U6MIR, and Sergei Avdeyev, U3MIR. Be looking for activity by them on 145.550 MHz.

KH2/KH0, GUAM AND MARIANA ISLANDS. Nao, JA1HGY, will be taking a summer vacation (DX vacation) to Guam, August 9 to 12 and Mariana, August 12 to 14. Callsigns will be KH2/JA1HGY and KH0/JA1HGY. Activity will be on: CW - 10103, 18073, (24893) and RTTY - 14088, 18103, 21088, (24923), (10145 REQUEST ONLY). QSL via JA1HGY.

KL7, PLOVER ISLAND, ALASKA. Larry, K5MK, will be active from here August 15-21 signing K5MK/KL7. This island does not have an IOTA number as of yet, but may receive one. Activity will be on 10-40 meters, including the WARC bands. For SSB: 14260, 21260, 28460 +/- QRM. For CW: Check 20 kHz up from band edge. QSL via K5MK or via Bureau.

S2, BANGLADESH. Jim Smith, VK9NS, is now active from S2-land as S21ZA. His 7 day operation should end August 12th. Most of his activity has been on 14022 and 14222 kHz between 2300 to 0030z. There was one report of him on 18077 kHz around 0630z and another on 21225 kHz around 1524z. It was reported on the INDEXA Net that Erik, WZ6C, has received the callsign S21ZB and Rudi, DK7PE, (who was recently in Angola as D2CW) has received the callsign S21ZC. There have been no reports on Erik using S21ZB as of yet, but Rudi has been heard on 14030 kHz around 0015z.

S9, SAO TOME & PRINCIPE. Sigi, DJ4IJ, is now active as S92IJ. He will be there until August 12. He was heard on the 14256 DX Net at 0015z. QSL via DJ5IO. Siji will return to Benin (signing TY1IJ) at the end of Sept.

TN, CONGO. Remember, Andre, TN1AT, will be on the 14256 DX Net this coming Saturday, August 15th at 2100z. QSL via F6FNU.

VE8CWI, CHARLTON ISLAND. The West Island ARC are now active from here until August 13. Charlton Island is located in James Bay, Canada, and has a new IOTA number of NA-173. Activity will be on all bands including the WARC bands on SSB/CW. QSL via VE2SEI.

VS6, HONG KONG. (More information became available.) Tim, KJ4VH, from the Southeastern Cluster Group, will operate as KJ4VH/VS6 or VS6/KJ4VH from August 11 thru 17. His time will be limited and plans are somewhat uncertain. He will operate when he can on either 8 or 28 kHz up from the lower band edge. Also, he will try to be active on the WARC bands depending on the antenna circumstances. Most operating times will be around 1100z.

XU, KAMPUCHEA. Manfred, DJ4OF, has a 9 month assignment with the local police in XU-land. As of yet, no Ohio/Penn Cluster spots have been reported on XU/DJ4OF. Meanwhile, XU8CW continues to be active until the end of the month. Check around 18071 kHz between 1330 to 1530z. QSL via FD1GTR.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA (PM)

What about "I've arrived (at my destination)"?
"I'm at [home|work|etc.]"?

"Destinated" makes me want to throw the rig out the car window ;-) !

Best 73's :-) :-)

What in the world is wrong with "I have arrived"? "I am here"? "I am home" or "I am at X"? Or, heavens, what about "I am at my destination"??? Are we (hams in particular, and the human race in general) so lazy that we have to make up a new word ("Destinated") in order save ourselves using two 2-letter words? Our hobby is built around communication, yet we seem bent on doing it in as few words and as short a time as possible. I can understand that with CW (repetitive motion injuries are no fun, believe me), but voice gives us a wealth of words to choose from and a piece of physical apparatus -- the jaw -- that is almost completely indefatigable...

Help stamp out the use of "destinated" in our lifetime! :-)

>up won't be a waste of time?

Louie,

You do have a good point about the usefulness of a published agenda
for ARRL Forums. But the lack of an agenda doesn't necessarily mean that
it is intended to be only a piss-and-moan session. The ARRL Forums I have
attended have usually included a presentation by the Division Director,
outlining the major ARRL "hot buttons" and a request from the Director
for input and guidance from the membership on the present issues. The lack
of an agenda does not, in and of itself, take away from the usefulness
of what occurs. It may indicate that the Director just *assumes* that
everyone knows what his forums are usually all about (not always wise
to assume anything in life, but it happens all the time).

On the other hand, League forums are not intended to be a barrel of laughs.
When I go to a government meeting, I don't go to have fun -- I go to
get something done. I can never be convinced that the best way one can
solve a problem is by being a non-participant. So I attend the ARRL
Forum at every convention (besides, I have to! The Director usually
insists that he HQ staffer shows up. :-) I would show up anyway.)

I do regret that we have not been able to serve you well enough to keep
you as a member. Could you (and any and all who choose not to be League
members) tell us what we could do that would make ARRL membership worth-
while for you again? I know that your reasons for not joining are not

because your Director holds a lousy forum :-), so do let me know. (I also suggest that you talk to your Director about it, too.)

John:

There is a ham radio club in Richmond (and Eastern Kentucky
University). I believe it is called EARS for Eastern Amateur Radio
Society. For further information, you can send E-mail to
DPSMCOO@acs.eku.edu. Also, send mail to the postmaster at EKU
(postmaster@acs.eku.edu) and ask for the e-mail address to Margaret
Lane, from whom you may also obtain additional information.
This organization is very active in repeater usage, field days,
studying for the license tests (novice, technician, etc.), holds
frequent meetings (for business and studying for the licenses), and I
highly recommend it.
If you are unsuccessful at obtaining information from the above-
mentioned sources within a reasonable period of time, please E-mail me
and I will get the information from home. (I'm currently at U.K.)
You can mail me at this address, or my other E-mail address, which is:

stamps%ccvs03.dnet@net.Vanderbilt.edu

Gordon Brandenburg and William Smith, both of Lexington, are
generally recognized as the main repeater engineers for the Lexington
repeater and those in the surrounding counties.

From: jangus@skyld.UUCP
Message-ID: <713459578snx@skyld.UUCP>
Source record: 285980

Time to join the fray.

What happened to the Orange covers?

But seriously, some thought should be given to getting the League (Yes, I support keeping the name the ARRL) to get it's manuals and books in order.

I know, its a difficult task considering the major changes that have happened in the past twenty years. But it would help the image a bit when you look in the Handbook and under the heading "Digital Communications" it didn't have a picture of a Teletype (tm) Model 15 as the state of the art.

The antenna book could use some help too if it didn't act like the be all to end all is a monstrous array at 100 feet or a 20 acre rhombic.

QST used to cover a WIDE variety of subjects. Remember when Television was THE new thing? Also radio controled models? Surplus gear conversions. I know, things have changed. There aren't anymore pallets of ARC-5 radios laying about.

How about some articles on ISDN and how it applies to amateur networking? How about how to get DXCC (if you really must) with 100 watts and a dipole? How about articles on working public events without appearing as a wannabe-cop?

Yes, I remember QST from quite a ways back. Most of the other mags as well. I've seen a LOT of changes in the hobby. There is no reason why things can't progress and stay in touch with the way our world is today.

>Comments, anyone?

Well, 300 watts for this unit assumes that it's operating into a flat 50 ohm line, kind of redundant. It's actually a pretty good QRP tuner. If you want to see what a real 300 watt tuner looks like, check out a Johnson Matchbox.

In matching certain loads, the Q of the matching circuit can become quite high. That leads to arc overs due to the high RF voltages and component melting due to high circulating currents. So the components in a 300 watt tuner need to be rated for at least 3 kW. Think about that for a moment. A good tuner is going to cost nearly as much as a good amplifier. MFJ equipment is fairly good value for the money, but you need to understand that their ratings are based on advertising and not engineering.

You can ususally avoid high Q situations by selecting another value of inductance, but you have to understand what's going on or you're going to fry a tuner. If the dip is real sharp, try a different setting.

Ha! Try using 'indefatigable' on the air.... some hams are liable to
ask you if the condition is serious :-)

We're talking about the evolution of language here. There are hundreds
if not thousands of words in use today which are less than 100 years old.
Arguments about the misuse of language should be limited to those
concerning grammar and sentence structure, not, in my opinion, to the
introduction of new words.

I know of no hobby which does not have a certain amount of jargon
associated with it. Some hams will insist that good operating practice
demands that jargon not be used while others either use it or simply
ignore it. Personally, I've been verbally chastized over the air for
using the term 'QSL', and I must admit that since then I've minimized
my use of it. On the other hand, did I really deserve a tongue lashing?

I think not. Ironically, the person who verbally spanked me was an
old CW op, (oops, there I go again, sorry), continuous wave operator,
who was quite disgusted in my having bastardized _his_ vocabulary.

So, to answer Faiths' question of "What in the world is wrong with..."
I would have to respond by asserting that it's not a question of being
wrong, it's a simply a matter of preference. It's just man's nature
to invent, be it words or whatever. Invented words like "destinated",
whose meanings are intuitively obvious, stand a good chance of
proliferating. It's one of those things which makes our language
interesting. They may tend to sound funny at first, but in time we
all learn to accept them, or perhaps they just fade away.

So, if you like a new word, use it. If you don't, then don't. It's
just as simple as a voice vote :-)

-fred

Some other language peeves of mine:

etc. (et cetera) - most people don't know how to pronounce it. I hate it when people say "ex cetra"

realtor - Again, most people can't pronounce it. It's pronounced real-tor, not real-a-tor.

modem - as in "I modem'ed it over to Joe..." - ugh! Now here's a place where a real word does exist - 'transferred'.

Message-ID: <Aug.10.17.49.12.1992.6382@pilot.njin.net>
Source record: 285951

> I'm looking for ideas on how people have mounted mobile radios in
> Caravans. Probably the best candidate place I have in my '92
> is removing the ashtray and carving out a hole for the radio there.

My wife's Grand Voyager is hooked up as following (no mobile rig).
There's a "Rig Saver" handheld mount mounted in the "cup holder"
recess on the top of the center console. The coax from this area
is routed down under the drivers seat where it connects to an RF
Concepts 2m/70cm amp/pre-amp. The coax from the amp runs up to
the roof mount Larsen dual band antenna. I didn't do the antenna
installation. All I know is that the cable disappears under the rung
and there is a permanent mount on the roof.

For power, in both my wife's car and mine, is delivered by adapting a
"50 AMP 4WD TRUCK LIGHT BAR KIT." This kit consists of a cable that
connects to a fuse box and a relay that is connected right to the
battery. A smaller wire runs to a switch on the dash (a whittled
hole in the fuse access door alows this to be done neatly). Turning
on the switch engergizes the relay and provides power back to the
big cable which ends up under the seat again. I know 50 A is over
kill for the RF concepts amp, but someday she might want to run the
HF rig there (who knows?).

Zack, I think you've just described the difference between tinkerers
and engineers. A good product is *engineered*, the rest just happen
to work. The difference between art and engineering is that the artist
rarely understands why he's doing something while the engineer usually
does. At the very least he has rules of thumb that he follows.

Now what several of us are saying is that we'd like to see articles
that lead up *from* random tinkering to real *engineering* of circuits.
That doesn't have to be extremely rigorous, we are amateurs after all,
but it should be better than what we have been getting. At the very
least, a series of snapshots of the author's thought processes as he
makes various design choices would be illuminating. Does that make
the author's job harder, it can if he doesn't keep an engineering
notebook. Perhaps an article on how to properly document work in
progress is needed. A "How to Design" series would be very useful.

I've had 30 years experience, and yet I still sometimes feel like
I'm poking around in the dark at the start of a new project. I've
developed a personal systematic line of attack that I use in such
cases. Write a specification, break the design into subsystems,
research, document, break the subsystems into individual circuits,
research, document, try out individual module designs, test to see

that they meet specification, document, iterate, system test, document, and iterate until success. Sometimes the iteration leads all the way back to rethinking the project. I'd really like to see how others attack the design problem. That insight could make me a better designer.

2004. I need NRD-525 RTTY board documentation.

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-10 22:16:03 UTC
From: rja@newbirth.Eng.Sun.COM
Message-ID: <l8dql3INNnp@exodus.Eng.Sun.COM>
Source record: 286055
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc,rec.radio.swap,rec.radio.shortwave

The title says it. I am buying a used NRD-525 HF receiver
which I believe has an RTTY demodulator. At least, the RTTY
light on the display is selectable and there's what looks like
a parallel port on the back of the receiver. However, there
is no RTTY doc with the receiver, and I presume that there
must have been some doc which came with the board. I'd like
to get a copy of the doc, or at worst, a JRC part number.
I'd be happy to pay a reasonable fee to cover the cost of
copying and mailing.

Thanks.

I need some advice on QRP transmitters or transevers and frequencies.
I am planning on trekking through a very remote area and would like
to take some form of communications with me. Weight and space are
at a premium thus QRP.

I currently hold a technician plus ticket (hope to have a general in
the next several months) so I need novice bands for now with say
20M later on.

I would appreciate any suggestions on radios, bands or just
plain advice.

Thanks.

Grammatically correct but semantically ambiguous (nevertheless, widely used and understood outside the ham populace): "Well, I'm here!" I use that one myself in preference to "destinated". But then, I also scorn "This is ..... for ID".

>I must agree that I also cringe when I hear the "destinated" term. The
>term originated out of necessity, because, there is no gramatically
>correct substitute for the word.
Well as John F. Woods alluded to above. There is a correct
meaning for the word "destinated". To quote from the O.E.D. "Destinated
Appointed, predetermined; destined, fated: See prec. vb " And the
preceeding verb referred to is Destinate.

What you say when you have arrived at your destination is "I
have arrived." It is no longer and more meaningful than "I am
destinated". Some said to me via e-mail, that when someone tells him
they are destinated his response is always: "I am happy for you, are
you going to Heaven or to Hell."
>
>In other words, it may sound "bad" but it's intuitively understood,
>and it fits in a place where no "real" word does.

But, there is a real word. The english language is a very rich
language. Only a poor command of it makes us think that it lacks words.

Yuppies, have alas, shown the shallowness of their education by
coining many of these words, often by using nouns as verbs. Ariadne in
the New Scientist Mag used to rail on about this. Maybe we need a 12
step prgramme for gerund abuse - that should keep the yuppies busy.

Yes, who was the most obnoxious station on the band and sent in
some numbers is more important than who was obnoxious and forgot to get
a licence first.
>
>>Local papers do a better job than this on crime and court reporting.
>
>Your local paper probably does a poorer job on other things than QST does.
>There might be a reason for this. Try thinking about what it might be instead
>of reflexively raving AGAIN about the ARRL committing crimes against humanity,
>OK?
It is not a crime against humanity to fail to report properly.
It is the correct reporting of alleged transgressions that helps
prevent crimes against humanity. History should illustrate this.

Also it is not reflexive raving. It is something I have been
concerned about for some time. I was also vocal about such sloppy
reporting in European newspapers. If my local rag got sloppy with the
court reporting, they would get a stern note from me.
>
>If you feel a personal need to know these people's names and addresses, phone
>up the FCC and ask them; if you are certain that the vast majority of hams
>feel that burning need, start up a newsletter. Don't be too terribly
>disappointed, however, if *I* don't rush my check off right away, because I
>personally have other priorities for my reading time than finding out the
>names, ranks, serial numbers, and favorite soft drink of radio pirates.

Such reporting would not be for you, but as I said in my
previous post "So justice can be seen to be done". This is not to
supply titillation, it is to ensure that people recieve a fair trial.
Then we can hang em, when we all know what thier transgerssions are.

Maybe I can illustrate this with a little tale. I was once
sitting in a magistrates court (Lambeth, Magistrate Burt) as a
reporter. One of the cases that morning was a child molesting case - A
hairdresser had copped a feel from an 11 yr old girl. I was in the
court for the preliminary stuff, then left as I knew the court would be
cleared when the child was called as a witness. So I went to
have a quiet smoke with the jailer (P.C. Sidney Smith). When the case

was over I re entered the court. The Magistrate gave me a stern talking to about leaving the courtroom. Why? A disinterested member of the public should have been there to ensure that justice was being done I was told.

So that is why I feel if someone is accused or convicted, we should get the details. Not "More enemies of the state have been exiled".

>does. At the very least he has rules of thumb that he follows.

Unfortunately, engineering has its own set of problems: one more-or-less-local
ham has a reputation for engineering circuits all out of reasonable
proportion. The example that comes to mind is a fan controller with 42 parts,
four of them ICs. Now really - isn't that a bit much?

The best designs are equally artistic and scientific.

>while for you again? I know that your reasons for not joining are not
>because your Director holds a lousy forum :-), so do let me know. (I
>also suggest that you talk to your Director about it, too.)

This is really quite simple.

Do something that reflects my interests and needs in Amateur Radio.
Do something *interesting* to me. Quite simply, the ARRL doesn't; or
they choose not to. It makes no difference to me.

Looking at QST, on occasion, I'm just not interested in HF, DXing,
DXpeditions, contesting, traffic handling, QRP, or that
needless-serial-killer-of-trees: the dreaded "Section News." When I
occasionally buy a QST, the first thing I look at is "Amateur
Satellite Communications". Then some ads or the occasional interesting
techinical article. The character of the magazine, as you might
expect, reflects the character of the organization and its members.
But it doesn't reflect mine. I don't claim that its bad or wrong, but
don't claim to represent all amateur. You represent your members.

As I've mentioned before, I support organizations that *do* reflect my
interests and provide something of value to me. I'm an AMSAT member
and I make an extra contribution to the Phase-3D project. I'm not
active on the satellites; due to CC&R problems, I don't have
reasonable antennas. But these folks are doing something to futher
the future of Amateur Radio that I'd like to see. It is interesting
and challanging to *me*.

Given the choice between spending the additional dollars to join the
ARRL and making an additional contribution to AMSAT, I think my
dollars do more good in the Phase-3D project fund. At least I'll
personally be able to benefit from them in the future. I can't say
the same thing about an ARRL membership.

One man's opinion,

louie,
WA3YMH

2014. cushcraft R7 in an apartment (help)???

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-11 04:41:23 UTC
From: pitonyak@cis.ohio-state.edu
Message-ID: <1992Aug11.044123.10476@cis.ohio-state.edu>
Source record: 285998

I live in a partially submerged 3 story apartment and was given
permission to put a "nonobtrusive" (read low visibility) ham
atenna on the roof. It must not be perminantly attached to
anything etc......

I have limited access to the roof so I need to put something
up there and not worry about it. I had considered putting a
mobile wip up top but was told that I lacked a sufficient
ground plane. It was recommended that I go with a
Cushcraft R7. It gives me 7 bands and does not have any
ground radials.

I am thinking of making some sort of movable stand which I
will then weight down so that it will not blow over......

Comments and suggestions would be greatly appreciated.
I am not really familure with the antenna but I do have
what I believe to be a drawing of this antenna.

Thanks in advance,

andy (pitonyak@cis.ohio-state.edu)

From: rovero@oc.nps.navy.mil
Message-ID: <5860@taurus.cs.nps.navy.mil>
Source record: 285937

I tried e-mail, but it bounced.....

The CMH-532 (RS-232 mini-manual) and 525 service manual have a little info on the CMH-530 RTTY adapter..... but no operating instructions other than a cryptic entry about entering the shifts and speeds using the numeric keypad.

The service manual has 1 page of general text, a board layout diagram, and a schematic (including parallel pin out, D0-D7 plus notSTROBE and notREADY). The CMH-532 mini-manual shows that decoded RTTY is available on pin 10 of the mini-DIN type serial connector at RS-232 levels.

If you need the info, please send me your snail-mail address.

In article <641@swamps.UUCP> val@swamps.UUCP (Val Christian) writes:
>I'm looking for ideas on how people have mounted mobile radios in
>Caravans.

I have found that the best place to put the radio is on the
camel immediately behind the lead beast. The second animal in the
string is usually pretty well behaved and will not object to having to
carry a couple of large batteries to power the radio.

Some of the U.K. readers may suggest mounting the radio under a
storage cabinet, near a bunk. Some caravans are made of fiberglass, so
they may work with inside antennas, but an antenna on the roof is best.
For HF, you can often mount a whip on the tow bar.

From: barkman@gamma.is.tcu.edu
Message-ID: <11AUG199201272323@gamma.is.tcu.edu>
Source record: 286000

First, I would like to thank those people that replied to my post.
Now, some people didn't have a clue what I was talking about. Others
don't think the 741 can do direct frequency entry. Well, to all the skeptics
and all the confused people, the way to do this is......
Hold the F and VFO keys while turning the radio on. The PF key is used as
the Enter key. Then you can directly enter the frequency you want without
having to turn the dial to oblivion. NOTE: You can only do this with the
optional tone decoder board. This board gives you other neat features as well.
Now if they would only put a keypad on car AM/FM radios.

2023. Craftsmanship is dying

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-11 09:34:27 UTC
From: motoyama@harl.hitachi
Message-ID: <MOTOYAMA.92Aug11183427@harlgw92.harl.hitachi>
Source record: 286005
Cross-posted to: sci.electronics,rec.radio.amateur.misc,rec.radio.shortwave

I bought a junk signal generator with eight tubes, and at last repaired
it last evening. An SG was my dream in my high school days, say, thirty
years ago. The price at that time was as much as my fathers annual income.
It weighs more than 50lb. Its performance is poor, frequency drifts as
getting warm. It takes about two hours till frequency becomes stable.

However, I am very happy with looking at a silver plated logarithmic
variable capacitor driven by sophisticated gears, hand wound OSC coils on
white ceramic bobbins. Yes, all of those things are obsolete today when
craftsmanship in electronics is dying, or at least, getting invisible.

I agree that one of eventual aim of electronics is to eliminate any mechanism
that moves. But.......

I have a Alinco DR-590T mounted remotely under the drivers seat. The head fits perfectly in the console cut-out above the radio - you just have to cut a very little hole to feed the control cable through. For an antenna I use a Larsen dual-bander mounted on the drivers-side front fender using an "L" bracket.

Message-ID: <9208111229.AA04641@cmr.ncsl.nist.gov>
Source record: 286007

Ok folks,
I, too, would like to see more "why" in QST articles. An example of the direction that would please me is the discussion in Rick Campbell's story on his Direct Conversion Receiver in August QST. I fear the purported subject may have turned off a number of people in this newsgroup - but there is a lot of good background applicable to any receiver in Rick's article.

Is this style of article what we want to see (on OTHER SUBJECTS, too) ??
I do.

BZZZZZTTT! Wrong. No points. Page 66 of the manual explains that
if you press and hold 'F' and 'VFO' while powering up, you can get
the described functionality.

But it also does what you say, too.

>But then, I also scorn "This is ..... for ID".

When I first became a ham, I couldn't understand what the /4ID suffix meant, and became the laughingstock of the local ham meeting when I asked. It seemed a natural mistake; how many times had I heard some local old fart chant in the middle of his transmission "W6OF/4ID"? Wasn't in the ARRL handbook anywhere!

Consider this for a moment: the only reason you are saying your station's callsign is "for I.D.", presumably a required identification.

Of course, if you're on your local gas channel (typically one of the local open repeaters) you know everyone anyway. Then the old rule of thumb applies: "I know who you are, you know who I am, and the FCC only cares every 10 minutes".

I hear people who identify at the beginning and end of each transmission, no matter how brief. Lots of times they use phonetics. By actual word count, chanting their station's callsign occupies more of the transmission than the purported content. But I digress.

>ham has a reputation for engineering circuits all out of reasonable
>proportion. The example that comes to mind is a fan controller with 42 parts,
>four of them ICs. Now really - isn't that a bit much?

Depends on what of the fan was being controlled. I've seen fans used as
ballasts, as transformers (two windings on the stator), and as part of
protection circuitry.

In one design, the fan speed is proportionately controlled to hold the
unit's temperature as constant as possible. People of shallow
understanding might not know that's what's being done and would
pooh-pooh the circuit as needlessly complex.

In a power supply that a fellow engineer designed the fan current is
sensed as part of the protection circuit. When the fan filter loads up
with dirt, the fan cavitates so its current draw changes and the supply
shuts down with a 'change filter' fault light. This is much cheaper
and reliable than the equivalent air-flow-sensor circuit would be.

Oh sure, it could just be incompetent design. But you need to make sure
that it's the design and not yourself that's incompetent. Don't ridicule
something until you understand its purpose.

<Cross posted to rec.aviation>

Hello,

I would appreciate advice from rec.radio.amateur.misc readers on the following item. I will be flying from Toronto to LGA (aboard AA), and transferring to JFK for a connecting flight to Spain (Iberia).

-> I am planning to bring my Sony Air-7 scanner to Spain with me. While I know that it is not permitted to operate a radio scanner without the permission of the carrier, what about actually bringing the scanner onto the aircraft in my carry on luggage? Is it ok to bring it on board as long as I don't use it? What sort of reaction can I expect from security people if they find out I have the scanner in my carry on luggage? Do I still need permission just to carry it on board? If I do have to ask for permission, what is the best way to go about it (I leave this Saturday)?

Thanks to all.

The recent list of ham radio books was really quite useful. But I have another request.

I have only found one series of small novels that contain any appreciable reference to ham radio: the Tommy Rockford series that can be obtained from ARRL among other sources.

Although I am not a literature critic, these are not the best written stories that I've read.

Has anyone seen any other ham radio fiction. I'd like to read it myself and I think that it would be a good way to get young people interested in the hobby as well. I spoke to the local librarian who had not heard of any but promised to order this type of book for the library if I could come up with some titles.

Please post your responses to the net.

Tnx es 73,

I agree. I recently published my first project in a scanner magazine; it's an indoor loop antenna for HF made from rotator cable and containing its own built-in tuner (SP6T rotary switch and variable capacitor).

Obviously, I tinkered, and got it working. But along the way I taught myself about tuned circuits, impedance, antenna patterns and etcetera. I got my Advanced ticket along the way, but there's still much I need to learn.

"Communications Quarterly" sounds like a magazine I'd enjoy. Also note some other excellent examples of technical writing: The recent article in CQ about Clover was one of the best articles I've seen all year. "The Satellite Experimenter's Handbook" has a chapter on orbital mechanics that is wonderful to read, even for the mathphobe (I'm a mathklutz, myself). It *can* be done!

>>I'm destinated".

As a new ham, I was reading r.r.a.m, 73, QST, etc before I had a rig, and noted the frequent disparagement of CBer's for (among other thing) "silly jargon".

I had barely turned on my radio five minutes before I heard someone use 'destinated'. Also "XYL", "73s", and many Q-codes. (I'm talking about 2m voice - not CW where Q-codes and abbreviations are appropriate)

It rapidly became clear that ham's own jargon was as specialized and (at times) as "silly" as CB talk of "bears" and 10-codes.

I like and use ham a lot, but find the put-downs of CB misplaced. CB can provide more apropos driving info than ham, and the exchanges on channel 19 are often much shorter and to-the-point than the chatter on the average 2m repeater.

> Does any one know the real story?

The French guy (name escapes me, too) was
doing something with listening to high-frequency
sound by mixing it down to audiable frequencies.
Armstrong knew of this work, but was the first
to apply it to radio frequencies, and certainly the
first to apply it in a working receiver. Saying that
the Frency guy invented the superhet would be a bit
like saying that the airplane was invented, not by
the Wrights, but by the first person to make a
paper airplane. The book from which the PBS
film was derived, also called Empire of the Air,
goes into considerable detail on this issue.

The R7 is not that heavy. We mounted one with a Radio Snack roof tripod. I'd suspect that if you put a short pipe into a concrete filled tire (like we used to make to support volleyball net poles) It would be sufficient.

The R7 would be infinitely better than a Mobile HF antenna (even not counting the grounding issues).

I recall learning that Armstrong invented the superhet, FM and
I believe another receiver type, I am not sure if it was the TRF or
not. I learnt most of this stuff in the U.K., but I have to admit many
of my books were U.S. publications. Many from the dastardly ARRL, so I
could have been tainted.

I used to have a book, it may have been "Elements of Radio"
Marcus & Marcus, that had an appendix in the back with listing the
progress of radio (electronics for the young-uns) with all the
great names in there.

Wrong...

Well part wrong :-)

Yes the DTMF board allows for decoding of DTMF so that the receiver can be opened up.

But in the 741A (not the 941A), it can also be used while in the VFO mode to program a specific frequency into the radio.

Consult page 66 of the TM-741A manual, section 7-3-2...

" 7-3-2 Frequency Entry with DTMF Microphone

With the optional DTMGF unit DTU-2, the DTMF microphone provides direct keyboard frequency entry.

1. Press and hold the F key and the VFO key, then turn the Power switch on. The MC-45DM microphone PF key will perform the keyboard entry function.

2. Press the ENTER (PF) key to select the ENTRY mode. The digits to be entered will change "---".

3. Within 10 seconds of pressing the ENTER (PF) key press the desired frequency from the most significant digit. After the least significant digit has been entered the transceiver changes frequency.

Make sure that you are in VFO mode when you start....

This does not work on the TM-941A... I know I tried... The firmware in the TM-941A does not support this...

Read "Goedel, Escher, Bach: The Eternal Golden Braid" for insights into the
deep structure underlying good science, good engineering, and good art.
They're all manifestations of the same creative processes.

I recently designed a 6M 100W amplifier (with the assistance of VE7BPE).
I worked out the matching networks, then VE7BPE *simulated* on computer, which
turned up some problems. Redesign, and voila. One ham "accused" me of
being "scientific" -- he said he just builds the damn thing, and if it
goes up in smoke, the design is wrong. I can't help but feel that
orchestrating something like this using available tools is ultimately more
satisfying than futzing around until you get something you think might
work. It "feels" more creative.

2045. Re: MFJ quality?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-11 16:15:51 UTC
From: rkarlqu@hpscit.sc.hp.com
Message-ID: <50030024@hpscit.sc.hp.com>
Source record: 285940

Well, here's my experience with the MFJ-1229 RTTY demodulator including software for C-64:

1. Advertised as running on +12V. Actually requires a *floating* 18V supply. My whole station runs off +12V battery for emergency capability, so this sucks.

2. Advertised as having "split screen" software, which normally means you can be typing your reply while the other guy's data is still coming in. The MFJ software has a split screen, alright, but the tranmit field is inoperative while receiving.

3. Software is just barely usable. Doesn't even have "unshift on space" which even Model 28's routinely had (an even some 15's!). Errors in table for decoding Murray code. Took me one afternoon to fix all the bugs. Why couldn't they have taken the time? (and I'm definitely no programming whiz.).

4. Advertised as supporting any shift from 100 to 900 Hz. Actually, the mark/space filters are inadequate even for 170 Hz. shift, which is what is used 95% of the time on the air these days. Looking at schematic, I realize this design is a clone of the "ST-6" from Ham Radio Magazine circa 1970, except the 88 mH. toroids have been designed out in favor of active RC filters. While it may be possible to build a filter with 3% bandwidth that way, it requires much better engineering, manufacturing expertise, and components than MFJ is capable of. They should have stuck with the original design, which I know works because I built one in 1974. Should have kept it even after I was forced to get rid of my model 15.

5. The PC board was etched to within an inch of its life. Many traces are less than 10 mils wide (and not by design). At least a dozen traces are so overetched, they have sections missing. These were repaired with #30 wire soldered onto the stumps, and they didn't even epoxy the wires to the board!

As always, your milage may vary!!!

I really think you check out the Standard C558.
It has all the features that you want and is a very solid
rig. Looks good to. The C528 is the older version it also
is a very nice Dual Band Handi.

2047. Detachable Head Radios

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-11 17:18:30 UTC
From: dlp@zule.Eng.Sun.COM
Message-ID: <l8ftj6INN419@appserv.Eng.Sun.COM>
Source record: 286027

I recently purchased a new car and now I'm in the market for a real
mobile radio, instead of the HT approach I used in the last car. One
of the real reasons is the new car has fewer accessible panels than
the old one so I'm not comfortable with running coax up to the dash.

I am going to get a detachable head radio because it will allow me
to keep the antenna coax at the back and minimize the dash space
required for the radio. I'm considering three different models and
would appreciate any comments or feed back on the units.

The units I'm looking at are:

ICOM 901 -
Pro: Great expandability, snazzy fiber optic links.
Cons: Most expensive of the bunch.

Alinco DR599 -
Pro: Good price, 3rd generation so it should be about "fixed",
3 power levels.
Con: Mic must attach to the head, not expandable.

Yaesu 5200 -
Pro: Small. Wireless microphone option looks convienent
Con: Not expandable

Just given the ads and spec sheets I'm leaning heavily towards the
Yaesu because of the wireless mic, but I'm reluctant to give up the
901 expandibility, despite the added cost. The Alinco is there because
I really like my DJF1T and am hoping that the DR599 provides the same
bang for the buck.

I'm not going to have time to scan this list for responses, so if
you could send the information directly to me, I will summarize
the data and post it back here in a few weeks for others.

Also, any horror stories about transmitters in Acura's would be
met with open errors. The customer service department was pretty
squirelly on answering my questions here, even when I pointed out
that they tried to sell me a cel-phone which is a transmitter.:-)

Need help troubleshooting a transmit problem I', having with my
SB-102. I am getting a full power carrier out no matter what mode
I'm in USB,LSB and no modulation is detected on a nearby receiver.
CW mode produces carrier on key down only but is unmodulated.
I've pulled tubes all the way to the driver and this is where it stops.
Having no schematic or setup procedures and not over whelmed about sticking
my fingers in around all that HV can someone point me to some procedures
about this rig.

Agreed. And - surprise - those who are the most active users
of Q-codes on CW (military and merchant sailors) for some
reasons DON'T use them on phone... Or could it be that
they know better? (:-)

2051. Phone patch (?)

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-11 18:21:41 UTC
From: uri@watson.ibm.com
Message-ID: <1992Aug11.182141.14315@watson.ibm.com>
Source record: 285935

Hello,
Could somebody kind enough enlighten me on the
following subject(s) [e-mail is OK]:

1) What can phone-patch device do for you,
besides sending the audio from your rig
to the phone line, and transmitting the
audio from the line on the air? [Note,
that I'm NOT talking about AUTOpatch!]

2) There are several phone patches on the
market (prices are from AES):
a) MFJ-624D about $70;
b) NYE 047-00[12] $130-$145
c) CES 410 $200
d) CES - a whole lot more, but those
look rather like autopatches...

Any comments (good or bad) about these units?
What's the big difference between them, so one is
almost twice as expensive?

Thanks for any [useful :-] info!

Regards,
Uri.

This discussion brings to mind a part of George Carlin's stand-up comedy act that he must have done 20 years ago. He spent part of his act making fun of words that various groups have invented for their own convenience. Every time I am travelling and hear the stewardess tell me to check the overhead compartment and under my seat before I _deplane_, Carlin comes to mind.

It's not just yuppies (who superceded hippies and yippies) that play games with the language.

2055. Re: Mobile Dual Banders

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-11 18:50:40 UTC
From: whester@nyx.cs.du.edu
Message-ID: <1992Aug11.185040.21745@mnemosyne.cs.du.edu>
Source record: 285936

In response to the query about what mobile dual banders (specifically the Icom 2400 and Yeasu 5200) can do, I can offer the following thoughts:

If you use these rigs in a metropolitan area, then you can receive all kinds of radio transmissions all at the same time. :-)

A friend of mine purchased the Icom 2400 because he wanted a "do it all" rig that would be his mobile ham rig and replace his scanner at the same time.

Well, after about 3 days, he took it back to the dealer and exchanged it for the Yeasu 5200. It seems that the intermod and spurious response was driving him nuts! It was so bad here in Denver that he couldn't even squelch the interferrence out...it was stronger than the ham freqs he wanted to hear.

Another week passed with the Yeasu 5200. Again, the same situation. He again went back to the dealer and complained. He was told that intermod and spurious response is a way of life with all the dual band wide range rigs. They took back the 5200 and he purchased a single band 2 meter mobile the Yeasu FT-2400H.

No more interferrence...although this rig does have extended Rx 140-173 Mhz. He was told that this rig has a tuned front end that tracks the receive freq and limits the width of the "front door" to the rig.

Anyway, my friend has now purchased three of the FT-2400H rigs and has put the scanner back in place.

Moral of the story...make SURE that you can return or exchange whatever rig you get until you find one that you can live with.

Also check out any of the Drake matching networks (MN-4, MN-2000,
MN-7, MN-2700). The circuit they use guarantees that insertion loss
is independent of load impedance. Also, arc-over voltage is nearly
independent of load.

Yep, they have been real bad out here on the West coaster too! I called CQ
for about 10 minutes this morning and no answer. I only heard a couple loud
stations and that was it. Also noticed that 20 meters seems to be shutting
down early at night also. 40 meters hasn't been much better either...
However the A index has been rather high though and could explain the
poor conditions.

2064. CB vs HAM (was: Re: Silly jargon (was: QST Content))

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-11 21:10:26 UTC
From: djenkins@wang.com
Message-ID: <bsu85f.3g@wang.com>
Source record: 285946

ptrei@bistromath.mitre.org (Peter Trei) writes:

> It rapidly became clear that ham's own jargon was as specialized
>and (at times) as "silly" as CB talk of "bears" and 10-codes.

> I like and use ham a lot, but find the put-downs of CB misplaced.
>CB can provide more apropos driving info than ham, and the exchanges
>on channel 19 are often much shorter and to-the-point than the chatter
>on the average 2m repeater.
Guilty, as charged. (But then you've heard me on 147.315 so you know that ;-)

I agree with you that CB provides more relevant information about traffic and road conditions than is available on 2M just by simple density of reporting stations. That's why I still keep my CB in the trunk. Next time I'm PARKED on Rt 2 I am much more likely to find out why on channel 19 than on 2M.

Also, you are quite right about the Silly Jargon. What's worse is that it is contageous, just as "awesome" and "wicked" have escaped from my lips.

I find the elitest attitude funny when you look at how many of us came from CB land in the first place. Clearly, in both CB and HAM, both ends of the spectrum are WELL represented. While it does seems that the AVERAGE is somewhat higher on the ham bands, some of the folks I knew from my CB days were "better" people (more compasionate, more polite, more tolerant, more open minded, etc.) than SOME of the HAM's you run into on the air. We won't even mention those qualities with respect to the net. ;-(

BUT... I do *NOT* miss the likes of the guy who, once a month or so, would ask for "Information" and then ask the poor unsuspecting trucker "Why are all truck driver's such @#$%^&* assholes?". Then a few dim bulbs who couldn't understand that this jerk WANTED them to get mad at him, would start a flame war that could last most of my commute.

All told, I agree that the prejudice some of us have against CB as a whole is misplaced. Some of the folks in CB land make it seem justified. Most do not.

I happen to be a White American Male. There have been quite a few of THEM who have earned their place at the bottom of the barrel but *I* would not appreciate being placed with them. Hasty negative generalizations are never good and nor completely acurate.

I have been using mininec3, but don't like the constraints on pulse numbers.
Does anyone have a version translated to C or Pascal? Is NEC available to
the public?

Please E-mail me. I don't normally read this group.

| >But then, I also scorn "This is ..... for ID".
|
| Consider this for a moment: the only reason you are saying your station's
| callsign is "for I.D.", presumably a required identification.
+---------------

Which is why I don't use it. (I should probably have used the word "spurn" instead of "scorn", or something even clearer; it appears I've touched off a slightly inappropriate reaction....) I just tack my call, unadorned, onto the end of a transmission every 6-8 minutes.

> Excellent reference! I could never understand what they had against
> the phrase "get off". Disembark? Un-board? Oh well.....

Maybe it has something to do with those Mile High Club types "getting off" while the flight is in progress :-). Leer, leer. And as for "disembark", well, that's the same sort of word as "deplane"; it's just been around longer. A "bark" was a type of ship, and when people got on it, they would be said to be "embarking", and when they got off it, they were "debarking" or "disembarking". Over time, the usage of these words has become more general. Airline jargon of "emplaning" (yes, I have seen the term "passenger emplanements" used to mean the number of people getting on airplanes at a particular airport) and "deplaning" looks rather conventional in this light.

As for what this might have to do with amateur radio, I have no idea.
-Steve

2070. Best way to leard Morse code?

What is your recommendation of a way to relearn Morse code? I have a Tech license and it's been years since I got my Novice and even used code, but I have developed an interest in upgraing to General and maybe doing some code on HF.

Tell me what you think about ways to learn code - specific tapes or computer programs.

I have tried worked all states QRO, QRP, QRPP and ESP. In each case, Utah
was my last. :-).

>Also, I have worked a Vermont station that hasn't QSL'd for a couple
>of months now, after 2 SASE's. A backup QSO there would also be
>appreciated.

I have found a good way to get QSLs. I send my QSL, and SASE, an already
filled out U-fillem QSL card (in case the station doesn't have QSL cards)
and a pen! (That is in case the station doesn't have a pen!) I have found
my QSLL rate to be about 90%. For the other 10%, I send a followup asking
them to return the SASE -- I need the stamp. That has never worked, but
it always makes me feel better. :-)

Buy the set of Gordon West tapes. His approach is about as much "fun" as learning CW can be, and you can just throw the tape into your player in your car or wherever and listen whenever you have a chance. He wants you to hear and recognize the letter sounds, not just sit down and "copy CW." My wife learned it quickly, first to the 5 WPM level, and then to the 13 WPM. Getting on the air in the novice bands is also a good idea when you get a little facility with the code.

EHK> while for you again? I know that your reasons for not joining are not
EHK> because your Director holds a lousy forum :-), so do let me know. (I
EHK> also suggest that you talk to your Director about it, too.)

Ed, I just had to comment about your positive attitude and good approach. You have a great feel for life. I of course can't help with the answers, but I think that the perception of the ARRL is a lot like government and that is one of the basic problems.

Rather than hear (like I did last week from a "staffer") that ARRL bashing is the main topic in a magazine for which I write (RTTY Journal) I would much rather hear those words you so elequently typed "do let me know". For each in its own way did.

The RTTY Journal is certainly not a "ARRL" bashers organization, but rather, a group of specialized users who gather around a masthead much like the Contest Journal. I think education and open discussions are one of the things that are missing from the ARRL.

I will throw out an example. Why should Mt. Athos still be a country?

Armstrong was certainly the inventor of the superhet
receiver. This made radio communication a reliable,
practical medium. Almost every radio and TV owned
by everyone uses superhet technology. To me, (and to Ken Burns, the
maker of the film) Armstrong is just as much of a hero
as other inventors like Edison. It is too bad that so
few people have heard of him.

His story would also make a very interesting movie.

I just happened to be reading a book called FROM SPARK TO SATELLITE which mentions that Armstrong was serving in Paris when he was working on the superheterodyne. While there he corresponded and met with a frenchman named Lucien Levy. Levy also patented a superheterodyne design just a few months before Armstrong.

>Doug InterNet: 1acommgscod@strathost.stratcom.af.mil

It would seem that the balanced modulator is not being properly switched in and out of "unbalanced" mode. If I recall my old SB102 (sold 13 years ago), the mode switch unbalances the balanced modulator for CW and TUNE carrier. Somewhere along the line, perhaps this isn't happening -- mode switch problem, wiring problem.

Another remote possibility: when I assembled mine, I got driver oscillation by not soldering the bandswitch shields well -- it was hard to do this, because the solder wouldn't adhere to the plating on the steel shields. This resulted in driver oscillation, which tuned with the driver tune control. Of course, if it were this, you'd know it by the buzzy, ugly quality as heard on a receiver. I filed the surface rough, and just applied tons of heat to get a reasonable connection, and all was well.

I also zapped myself from the key line with the +240 volts -- a diode misplaced! There was smoke, too... that was a case of the initial "smoke test" and the "built-in digital wattmeter" test!

Thanks for the chance to reminisce. Hope you can solve it.

>or not the ham is trying to obscure the meaning of the transmission.
>(See 97.113 (d).) Whether or not your local listening station is
>Zip or Stuffit savvy is another question.

A question that needs to be addressed is *why* the FCC has the plain language rule. Originally this was to prevent German *spies* from communicating back to Berlin. Now since amateur operations were *suspended* during both world wars, this restriction is rather moot. The other reason was to stop commercial incursion into amateur channels. Now IMHO that is mostly a moot point as well with the advent of modern communications networks. Few businesses would trust important information to amateur networks. If any *did* setup such a network to interoperate with amateurs, it would benefit the amateur more than the commercial user. Note that encryption *is* legal in commercial service. Again IMHO, this rule should be revisited to see if it's necessary today, if it ever was.

Foreign PTT regulations are different which may preclude use of such techniques in international transmissions to those jurisdictions.

>In any case, there remain no standards for "plain language" in the
>world of compression. What if the FCC van doesn't have a Mac, and I
>transmit a Stuffit file? What about less popular compression formats?
>Compactor? FastBack? Norton? Not all compression software announces
>itself in the header. What would you have to send to make the
>FCC (and foreign PTT if you're DXing) happy?

The current rules only require that a station keep a copy of any non-standard code used in the station records. If the FCC wishes to decompress any message they may have intercepted, they can ask for a copy of the code specification to allow them to do so. They do not require that real time capability to decompress a file be available to them before you can use compression. Foreign administrations' requirements are different.

Technically speaking, the stub is a quarterwave matching transformer and
shouldn't radiate *at all*. Of course in the real world things are rarely
so perfect, but a J-Pole is merely a halfwave radiator end fed with a matching
transformer.

I hear all of this talk about Icom's W2A being so fragile.
I dropped mine while getting out of a Kenworth Tractor (Semi) and the W2A
fell about 10 feet down onto pavement. Not a scratch. Works fine.
I also filled up the ear-mike jack with water and when I dried the unit out
it works fine.
One thing I really like about the W2A is that I can leave it turned on and plug
in the cigarette lighter adapter and when I have my car's ignition on the radio
is on. When the car is off the radio is off (thus not draining the battery pack)
Had no problems with intermod in down town Baltimore City. New York city had
alot of intermod on 440 (from cellular phones). Boston was OK.

Oh yeah, BTW, I ALWAYS carry my HT in a case. Practice safe hamming.
WRAP that WRASCAL.

2088. Kenwood TH-78's Alpha-Numeric Paging

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-12 05:30:21 UTC
From: dakujak@wiliki.eng.hawaii.edu
Message-ID: <1992Aug12.053021.12731@news.Hawaii.Edu>
Source record: 285970

Does anyone know exactly how Kenwood's Alpha-numeric paging system
works? Specifically, can you use this system through a repeater?
Also, is there some standard to Kenwood's system which other manufacturers
will comply to if they decide to make a compatable system.
Any info is appreciated.

2089. Re: Differences between IC-W2A DJ-580 FT-470 TH78A

When I meant decode, I meant the ability for the radio to figure out
what exact CTCSS code is being transmitted on a frequency (i.e. 107.2) while
this tone system is being used by another radio.
I own a Yaesu FT-415 and it has this ability. What the radio does is
it scans through the CTCSS tones until one of them breaks the squelch.
My friend owns a W2A and it does not have this feature. I do not know
of any other radio that has this ability. Does anybody know of another
handheld that has this feature? or is it unique to this radio?

Dear all,

I am currently looking for a mobile receiver and have read about the
Kenwood RZ-1. Does anyone have any opinions/experience of these sets and
any information as to availability or sources.

I have heard that its only flaw is that you cannot squelch in AM mode
but this can be overcome by using an external amplifier for the audio.

Any pointers would be most gratefully received.

ZCZC AE04
QST de W1AW
DX Bulletin 41 ARLD041
From ARRL Headquarters
Newington CT August 7, 1992
To all radio amateurs

Thanks to Tedd, KB8NW, the Ohio/Penn Packet Cluster Network, G4ZVJ and WA4IUM for the following DX information.

ANGOLA. F6BLQ/D2 is now active from Luanda and QRV until September 3. Listen for this one on 14120, 14260, 18120, 21170 and 21260 kHz between 1200 and 1330z and 1800 to 2300z on weekdays, and 0800 to 2300z on weekends. QSL via F6ELE.

FROM THE DXCC DESK. Questions are being asked at the DXCC Desk about the status of S2/WZ6C and S21NQ cards. These cards are not currently acceptable for DXCC purposes. Should retroactive documentation be received for these operations, there will be a News Release from the DXCC Desk and a W1AW bulletin.

BANGLADESH. Jim Smith, VK9NS, is now QRV as S21ZA. Operation was said to have started on August 5, to continue for 7 days.

Another station became active this week with the possibility of more to come. Ray, G3NOM, is now active as S21U. He has been heard on the 14226 DX net around 2100z. It has been reported that Erik, WZ6C, will be picking up his S2 callsign in Dhaka very soon. S21A continues to be active on 14256 and 21335 DX Nets.

CENTRAL AFRICAN REPUBLIC. Serge, TL8PS, was heard this week on 14023 kHz around 2145z. QSL to Philippe, Box 265, F-67500 Haguenau, France. TL8IM was also active, but on the 14226 DX net around 2130z. QSL via AC3D.

HONG KONG. Tim, KJ4VH, will operate /VS6 on CW in early August. There is also a possibility of a weekend trip to Macao (XX9).

AMERICAN SAMOA. Andy, G4ZVJ, will sign KH8/G4ZVJ from August 12 to September 9 from Tutuila Island. Operation will be mainly CW with some RTTY/AMTOR. QSL via G4ZVJ.

NIUE ISLAND. Look for ZK2VJ from August 26 to September 2. QSL via G4ZVJ.

PERSEIDS METEOR SHOWER. Mark, KE7NS, is interested in running 2 meter meteor scatter and is looking for anyone to set a sked with him. The date for the Perseids Meteor Shower is August 11 with the shower's peak to occur at 2210 UTC. Mark's Grid Square is DN41, and he will be active portable on a mountain top, approximately 9000 feet. You can reach Mark at 801-399-1058 (Ogden, Utah).

SPECIAL EVENT STATIONS

SOLOMON ISLANDS. Local radio amateurs will operate H44GC from 0800z Friday, August 7 until 0800z Sunday, August 9 to commemorate the 50th anniversary of the battle for Guadalcanal. The operating site will be from an old base known as Fighter Two. SSB frequencies will be around 7080, 14280, 21380 and 28480 kHz. Look for CW activity 40 kHz up from the bottom of the 40, 20, 15 and 10 meter bands. For a QSL, send an SASE to K2PF.

FRANCE. To commemorate the 50th anniversary of the landing of the Allied Forces in the Dieppe area on August 19, 1942, the ARADAS (Dieppe Radio Club) will be active on August 15 and 16 from 0700 to 2000z. They will sign TM5JBL, with operation on 10, 15, 20 and 40 meters. QSL via the bureau or direct to PO Box 2005, 76070 LE HARVE CEDEX, FRANCE.

Message-ID: <9208121155.AA09273@cmr.ncsl.nist.gov>
Source record: 285976

Art or Engineering?
Gosh, the Patent Office still calls each technical field an "art". Some still refer to the "state-of-the-art" as a cutting-edge approach.

Jay Maynard tells of a friend who "engineered" a fan speed controller which included dozens of components.

I admit to approaching codger-dom, but back when I was in engineering school, it was emphasized that the job of the engineer was to make a sound, ECONOMICAL design. Perhaps too many electronic engineers have spent their careers on money-be-damned projects. There ARE another branches of electronic engineering where cost IS quite important. I have recently been involved on the fringes of a massively-parallel supercomputer design project. I can assure you that THOSE engineers care about costs, even though the product lists at up to about $50,ooo,ooo per machine.

Of course back around the turn of the half-century, when I was in school, it was assumed that many EE graduates would work in the consumer/radio industry. Then, too, that was in the bad-old-days when active components (tubes) were large, expensive, and used a lot of power. Solid-state devices have redefined the cost of complexity, to some extent. Adjusted for inflation, tube costs are probably about the same today as when they were the only amplifiers / oscillators available. How many transistors / ICs would you use in a design if they cost $5 to $10 each for just ordinary types? (and were as large as your thumb) ....

No, using more parts doesn't necessarily increase the overall cost of a product. More parts CAN sometimes be used to improve long-term system stability, and to reduce / eliminate the expensive alinement steps during manufacture. The bad-old-days approach of having loads of COMPENSATION controls, to (temporarily) achieve accuracy, is thankfully mostly behind us. OK, I haven't converged a TV picture tube lately, ugh.

What is your recommendation of a way to relearn Morse code? I have a Tech license and it's been years since I got my Novice and even used code, but I have developed an interest in upgraing to General and maybe doing some code on HF.

Tell me what you think about ways to learn code - specific tapes or computer programs.

You'll get a *LOT* of responses to this query Allen. Here's mine:
(This is supposed to be light hearted... Assume liberal usage of smileys.)

I prefer the immersion method. Just get into it and DO it. Get obsessed with it. Fill all your spare time with it. Become a bore with it.... Loose the microphone. Send it off to a hostile relative with instructions not to give it back to you until you produce a General Class license. Sell the HT and use the money to get a really good iambic key and a smart keyer (I use a Vibroplex iambic paddle and AEA keyer). Set up the keyer to generate random code in 5 character groups and adjust the speed so that you can copy four out of five characters correctly (Val's magic 80% mark.) Practice many short periods through the day, every day. (Six 10 minute sessions are much better than a single one hour long session.) Cut your car radio antenna wire. Tap out street signs on your knee, whistle license plate numbers... Use your keyer to make your own tapes at your own 80% speed and play them in the car when you tire of whistling. When you go shopping tap out the list on the side of the grocery cart. As you become more proficient you'll have to increase the speed of the random code in order to keep the comprehension at the 80% mark. Some days you'll be tired or out of sorts and may have to lower the speed to maintain the 80% mark, but the trend *will* be positive. Get into a big arguement with your wife and spend *WAY* too much money on a new HF rig, claiming you'll need it to work DX via high speed CW..... Each month as the payment comes due she'll remind you of how much you want to learn high speed CW (she'll give you *LOTS* of incentive). Get on the air using only CW (remember the hostile relative?) and work one QSO per day and/or three hours of ragchews per weekend. Teach Morse code to your children. They'll catch on faster than you and you'll have to work hard in order to save face.

The method I used was very close to this one. When I finally got the Extra Class license and no longer needed to immerse myself in CW I discovered that I had developed an appreciation for CW that I didn't have before. I made one contact via phone and promptly went back to the key.... Gee, I dunno.... Maybe I've become "ONE OF THEM"....

An old fart Morris code enthusiast....

Good luck Allen.

> Any info is appreciated.

The paging function uses standard DTMF ... if your repeater passes or can be programmed to temporarily pass DTMF then you could page through the repeater. A typical message could be sent to a TH28, TH48 or TH78 like this...

Message = CALLME

DTMF = # 2 C 2 A 5 C 5 C 6 A 3 B #

There are 10 receive message memories of 6 characters each, so you could send up to a 60 character message. The units also have 10 transmit message memories of 6 characters each.

Yah, Tad, but who'd WANT to?

I'm reminded of the first day I arrived at work at my new job. This
is during the time when every amateur active on HF agonized over the
truthfullness of the word WA4D being a four-letter one.

As I was being shown around the building, I walked over to the DXCC
branch. There was this little bottle there, with lotsa pennies, nickels
dimes, quarters, and yes, even a greenstamp.

Clearly labelled on the bottle were the three words:

Neuter The DAWG!

2099. R7 Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-12 12:50:34 UTC
From: harp@bnr.ca
Message-ID: <harp.57@bnr.ca>
Source record: 285880

There was a recent query about using the R7 on an apartment.

Well I finally got mine to work on 30 meters after adjusting the capacitor on the trap. You heat it with a heat gun and adjust it like a trombone. If you destroy the heat shrink on it put some new heat shrink on it.

Anyway the R7 is a vertical and performes like a vertical. It is about as light as it can be. It uses a special balun and seven whiskers on the bottom to prevent the need for radials. I got slightly better SWR by adding a coaxial balun (A roll of coax placed at the feed point).

A vertical on 40 meters may seem lousy compared to a dipole for daytime QSOs around the state. It can outperform the dipole when chasing DX on 40 at night.

I use it on a Motor Home. I attach it to the ladder. I worry that the wind whipping it will eventually loosen the ladder. It's better than using a mobile whip. I is easily disassembled and stores for travel. I can set it up or take it down within a half hour. (Not bad for a Gasping Geezer).

on any radio with CTCSS decode support I've found it trivial to turn tone on,
and then rotate the selector through the PL tones until squelch breaks.

Unless I'm wrong, the Yaesu 'feature' merely has the effect of somewhat
automating this process. Not a Primary feature, far as I can tell. Of course,
it would be a secondary or tertiary nicety...

2102. Antenna Modeling - performance results - YAGIMAX 2.21

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-12 13:17:48 UTC
From: rabassa_ao%ncsd.dnet@gte.COM
Message-ID: <9208121317.AA19841@bunny.gte.com>
Source record: 285882

YAGIMAX ver 2.21 Followup: Aug/12/92 NW2M
Yagimax was available via its' creator - K4VX, as I did.
The online callbook says:
K4VX:E:Griffith L Gordon:POB 105:Hannibal:MO:63401

I sent a blank formatted disk, mailer, return postage, and my thanks.
No other fee was expressed at that time (3/91)..... this is 92.....
an election year... need I say more.....

Performance (386-40Mhz, 64k cache, no math coprocessor, VGA),
5 Element yagi (HyGain model) 20 meter band:

30 seconds for full freq sweep (45 points - gain, F/B, Imp, SWR).
3 seconds to compute and display Smith Chart (color vga).
8 seconds to compute polar plot.
3 seconds to draw polar plot (color vga).
3 seconds to draw any other graph/chart (color vga).

VERY fast and VERY impressive. Please post your findings, the latest
version number, and notes from K4VX (wishes, etc...) to the net.

Any other questions about Yagimax, ARRL "Yagi Antenna Design" book,
antenna modeling, pitfalls, etc., drop me a line.

My original yagimax posting follows:
==========
.Antenna Modeling Program - YAGIMAX ver 2.21 Shareware Product
.
.I received a shareware copy of Yagimax from the author about a year
.ago. It was a PC based (clone or otherwise) software package.
.The package fits onto one 5 1/4 disk. The disk contains the
.Yagimax.exe, Install program, Gamma Match calc program, Taper
.correction program, and several data files (actual models!).
.
.Run the install program 'YMINST.EXE' and answer the video type and color
.selections you prefer. Instructions are included on the disk README.NOW.
.
.Running the program. The opening window (not a windows or X product),
.allows the selection for creating a new model or load an old one.
.Selecting LOAD will present a window of existing antenna files.
.Arrow down to your selection and depress enter. The dimensional
.data (length, width, spacing...) is displayed. DOS limitations
.allow short filenames - so be brief. NBS3217.INP would correspond
.to the NBS model at 3.2 wavelengths, 17 elements. Other filenames
.follow suit.
.

.The program is very easy to follow, and moving around is simple.
.It provides gain, F/B, SWR, and feed point impedances over selected
.frequency start/end points. You can maximize gain or F/B by element
.lengths or element placement. Assuming similar element construction,
.the balance point (CG) is computed and displayed. Polar plots,
.Smith Charts, Graphs, etc and be displayed. Stacking and height
.above ground results also computed.
.
.I entered the NBS model for 3.2 Lambda, 17 elements for 144 Mhz.
.The NBS and the Yagimax model numbers are in agreement !!
.My feed point numbers were 25 -20j (as an example) at 144.200.
.These numbers are entered into the GAMMA match program, assuming
.a gamma feed system, and the program computes gamma dimensions.
.At 144, no TAPER corrections are needed, but corrections for
.boom effects are computed by the TAPER program.
.
.In summary, a simple and easy program to use. For HF work, 3 to 5
.elements run quickly on my 286-12MHz VGA clone. 22 element VHF/UHF
.models took forever. Since then, I have upgraded to a 386 at 40 MHZ
.with 64k cache. Now it flies !!!! Yagimax also looks for a math
.co-processor.
.
.PITFALLS: Don't get caught in the deadly spiral !!! Especially with
.simple 3 element designs. Antennas should exhibit smooth gain and swr
.figures. F/B changes quickly - as expected. DO NOT try to squeeze
.the last .00001 dB out of the antenna !!!!! Models will allow a 100 dB
.gain with 400+ dB F/B for one frequency - but one 1 Hz will result
.in a 500 dB loss in gain and 300 dB loss in F/B and an increase
.of 100:1 in SWR! It does not exist !! Don't fall for it!!!
.Play it safe. Use one of the NBS (your tax dollars) models in the ARRL
.handbook as a starting point and 'touch-up' with modeling from there.
.
.73, and good luck. Al NW2M Rockville, MD (301)294-8621

gee, this sounds familiar.... sounds like me in, oh, late 1985 or so.

>Tell me what you think about ways to learn code - specific tapes or computer
>programs.

ok, here's what you do with tapes and code programs: dump em. problem
here is that after a little while, you've basically memorized the stuff
and you know what's coming before it ever happens. plus, IMHO, they're
BORING.

really, the best way is just to get on the air and make contacts. granted,
your first few contacts are likely to be very tense, and you might not
copy too well. get a friend to help you out there (a friend of mine at
Texas A&M did this for me on my first cw contact, and it was a BIG help).
let him/her copy behind you, and if you miss anything, they can fill you
in.

I think you'll find that the code comes back to you faster than you think
it will.... anyways, don't worry about it if your first few contacts are
tense and such --- it'll pass, and nobody will give you any static about
it (and if they do, they're probably not a licensed Amateur Radio Op).
IMPORTANT: DO NOT SEND FASTER THAN YOU CAN COPY! this was the one thing
that I got, uhh, reminded of by a few people...I'd call CQ too fast, and
then have to ask people to slow down. the reminders were always a gentle,
friendly reminder, but....

now, as for how effective this can be (and your mileage may vary), I went
from BARELY copying 5 wpm in late December '85 to almost passing my extra
code test (which I was only taking as a warm-up for the general code) on
1 March '86. two months, average over that period of 1 contact/day (more
like several per day, and then days off....I was trying to pass college
courses at the same time). when I took the 13 wpm code test, my biggest
problem was that I kept almost falling asleep (and kept thinking, ``ok,
anytime now, next letter please....'').

not too long after that, I was copying 28 wpm, and could send/copy at
that speed while also holding a conversation with someone in the room.
I was away from hf for a few years, and can't do that today, but....

on the air practice is, IMHO, the absolute best way to get your code
speed up. from what I've seen, the 2nd place position is *WAY* behind.

hope this helps....

2104. 9D - Legitimate Operation?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-12 13:45:07 UTC
From: dearnsha@wizard.worldbank.org
Message-ID: <1992Aug12.134507.2615@worldbank.org>
Source record: 285884

Two stations have recently been reported signing the 9D prefix. The stations were: 9D2RR on SSB, and 9D0RR on CW. They haven't been too active but the local packetcluster indicated that one of the operators name was Romeo (no doubt of 3W0RR fame). The 9D prefix is allocated to Iran (EP). Does anyone have any further information on this station? Is it legitimate (I've not seen anything in the newsheets about it)?

Thanks... Darrell NR3Y/G4MZF

Julian's points about "destinated" are well taken, but he really shouldn't cite the OED as a reference source. The fact that "destinated" appears there is irrelevant to its current usage. The OED is a wonderfully rich record of words that have been used in the English language, and as such it contains many words that have been dead for decades (sometimes centuries).

I don't like the word either, but Fred Lloyd's comments about usage eventually determining correctness are right on the mark.

Source record: 285889

I bought a used FT-470 and was not sure if the factory intermod fix had been installed. When I called Yaesu, they said you could not tell from outside the radio but if you went deep inside you could look for the numbers 21.15 on the Xtal filter. There had to be a better way.

We (a couple other HAMs at work got into this) understand that part of the factory fix for the FT-470 was changing the IF frequency. We checked a modified radio and the unmodified (We think.) radio by looking for reception at the IF frequency.

With the radio set to receive 146.85 MHz, we drove the antenna connection with a FM modulated signal, 1kHz tone with 5kHz dev. at between -20dBm to -40 dBm. The modified radio received the signal at 21.700 MHz and the unmodified radio received it at 17.300Mhz. Be careful when doing this that you are not picking up a harmonic of the injected signal. If tuning the radio makes the signal go away, you are getting a harmonic. If tuning makes no difference, you have the IF.

I want to buy a dual-band HT in Northeastern US on my way
from Ottawa to P.E.I., Canada this weekend. I can remember
two city on my way, St. Johnsbury, Vermont and Bangor, Maine.

I don't know what route you take to hit those two places...

Anyone can point me to a good place and a good deal?
Thanks for your help.

However, between those cities is New Hampshire where in the space of a couple of exits on Rt 93 you have two ham stores. Rivendell is at exit 4 in Derry (Londonderry?) near the Burger King about one or two streets from the exit.

Ham radio outlet is between 2 and 1 in Salem NH. I don't want to try to give directions here but you can call and get directions at 800 444-0047.

Rivendell is smaller but usually has a better consignment shelf. HRO is part of the chain and has a large selection but can be a zoo sometimes on the weekends.

Well, since Gary is looking for insights in the design process.
I've decided to brazenly reword a fundamental mathematical to get:

No set of design rules complete enough to be useful will yield
all the good designs. There will always be designs out of the
range of the design rules. A typical example is Lawsons's PV-4
antenna--which is an excellent 4 element yagi that violates the
rules he developed for designing antennas.

In fact, to get the most of a design, one of the first techniques
I often use is to throw away the rules of thumb and look at the
underlying principles. Those rules are often okay for typical designs,
but when you want high performance, forget them. This poses a problem
for most people in that you actually have to understand the circuit inside
and out. Since I often can't solve real life circuits with exact
equations, I sometimes resort to "fuzzy equations." These abominations
often have constants that are merely educated guesses. I am extremely
reluctant to publish such equations, since they are developed specifically
for given conditions. Its been my experience that a surprising number
of people attempt to use equations without understanding all the underlying
assumptions and constraints used in developing them.

However, these guesses can be surprisingly accurate. I really surprised
some people with the first 2 meter preamp I ever built. At 0.13 dB noise
figure and over 20 dB of gain, it came in second at the 1992 Central
States VHF conference. Maybe one day I'll go ahead and use the data it
was suppose to generate and improve the design.

From: walt@diusys
Message-ID: <BsvnnA.14C@news.udel.edu>
Source record: 285908

louie@sayshell.umd.edu (Louis A. Mamakos) writes:
:
: >I do regret that we have not been able to serve you well enough to keep
: >you as a member. Could you (and any and all who choose not to be League
: >members) tell us what we could do that would make ARRL membership worth-
: >while for you again? I know that your reasons for not joining are not

: This is really quite simple.
:
: Do something that reflects my interests and needs in Amateur Radio.
: Do something *interesting* to me. Quite simply, the ARRL doesn't; or
: they choose not to. It makes no difference to me.

Ed, I don't think you could fix the leauge to make this guy happy.
Unfortunately this is an all too common response from selfish
individuals who join an organization so that they "get something"
out of it. You can only get out of it what you put in to it.

: Looking at QST, on occasion, I'm just not interested in HF, DXing,
: DXpeditions, contesting, traffic handling, QRP, or that
: needless-serial-killer-of-trees: the dreaded "Section News." When I
: occasionally buy a QST, the first thing I look at is "Amateur
: Satellite Communications". Then some ads or the occasional interesting
: techinical article. The character of the magazine, as you might
: expect, reflects the character of the organization and its members.
: But it doesn't reflect mine. I don't claim that its bad or wrong, but
: don't claim to represent all amateur. You represent your members.

And dont you think that their members are amateurs from all walks of
life and of many and different interests? Maybe I dont read the entire
QST because I don't like its contents, but I dont blame the contents
on the entire organization. ARRL is more than JUST QST.

: As I've mentioned before, I support organizations that *do* reflect my
: interests and provide something of value to me. I'm an AMSAT member

AMSAT? Providing something of VALUE? Their publication is the PITS!
Whats that you say? AMSAT is more than just a newsletter? Hmm...

: personally be able to benefit from them in the future. I can't say
: the same thing about an ARRL membership.

Please tell me what AMSAT is doing for YOU PERSONALLY. Are they putting
up a satellite that you can use from your 2meter CB-set while tooling
around the beltway? Of course if they are doing that for you PERSONALLY,
then who else are you going to talk to?

So what will an ARRL membership do for you PERSONALLY? Probably nothing
that you would be interested in, nothing usefull to YOU. Standing watch
over congress and the FCC as they get money hungry and try to auction off
those frequencies that AMSAT is planning on using for your PERSONAL
satellite is one thing an ARRL membership will help provide. Helping
you find that pesky RFI that is interferring with your PERSONAL satellite
might be another benifit. Haw about when you try to put up an antenna
to access your PERSONAL satellite and there are city ordinances that
say you cant? ARRL maintains a staff of leagle assistants to help you fight
them. There is a lot more to ARRL that that dull magazine they put out
every month. If you don't realize what the ARRL CAN do for you, maybe
you had better find out.

: One man's opinion,

> while this tone system is being used by another radio.

I own a TH-77A and previously the TH-75A. The technique to figure out what is the PL code in use is to turn on the CTSS on the HT and then select PL tones until you break squelch. I used this to figure out what PL the security guards were using during a recent emergency drill at work. Of course, this may be beyond some HAMs now, (insert the license class, age group or other category of your choice here) so that feature is a nice one.

PS, the above questioning of some HAMs abilities was not meant to reflect on dakujak@wiliki.eng.hawaii.edu whom I quoted for the sake of identifying the feature of the ICOM W2A hand held.

>OK,OK....of course the beam/quad or whatever must be "better" or there
>wouldn't be so many users 8^) !!
>
>Jerry, K1MER

I have a R5 as well as two yagis, a Mosley PRO-96 (36' boom) and a Cushcraft
A3 (14' boom). While the yagis generally outperform the R5, from a little
to as much as 6 S-units, I still use the R5 for the purpose suggested above.
When digging around for DX if I tune across a weak signal on a yagi I
switch over to the vertical. If the weak station is near the same strenght
or stronger on the R5 then the yagi is pointed the wrong way. Time to start
turning the yagi to peak up the signal.

There was a time when the R5 was my only antenna. It works quite well and
I had lots of fun and contacts with it. However, it doesn't really
compare to a yagi. Even a small yagi like the A3 at 40 feet or so will
outperform the R5 99% of the time (IMHO and experience). Another advantage
of the yagi is that vertical antennas generally pick up much more electrical
(line) noise and computer hash than the horizontal.

The W2A does have the ability to do this. I can figure out what pl
someone is using in under 5 seconds every time. Your friend just
doesn't know how to operate his radio.

2122. Data Tech 30A DMM reads 0 ohms

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-12 17:34:47 UTC
From: moisan@silver.lcs.mit.edu
Message-ID: <1992Aug12.173447.11060@mintaka.lcs.mit.edu>
Source record: 285910
Cross-posted to: sci.electronics,rec.radio.amateur.misc

I've a Data Tech DMM, model 30A, circa '77, that has a fault: On the Kohms scale, it reads 0 ohms at all times, regardless of the resistance across the test leads. DC Volts works OK.

I'd like to fix this--it's a nice (if old) bench meter, with a _true_ 3-1/2 digit (5000 count) readout. Can anyone help?

Thanks,

Dave

2123. Wanted Santec HT1200 mods

Newsgroup: rec.radio.amateur.misc

I'm going by memory here, but I believe he invented the regenerative
detector. Also the OSCILLATOR. RCA successfully argued in the
Supreme court that since they had observed (unwanted) oscillations
in experimental telephone amplifiers that they, not Armstrong,
were entitled to the oscillator patent.

From: jerryp@key.COM
Message-ID: <3486@key.COM>
Source record: 285903

We all know of hams that *should be* convicted of felonies :-), but a question was put to me a few days ago: Can a convicted felon, on parole, recieve a amateur license?

I know the FCC will look in askance upon you, if you used a radio in the commission of a crime, but if the crime did not involve radio would a license be granted? Or does the loss of rights that accompany a felony conviction also include a loss of amateur privileges?

That leads me also to ask: "What happens if a licensed amateur is thrown into the big house? If the license isn't automatically revoked, and given the size of todays QRP and packet rigs, the possibility of a new contest award arises: WAP - Worked All Prisons. Hey, I bet they could even have a section report in QST! A untapped source of new ARRL members! Are you listening ARRL?

(Big Smiley - But the first question was a serious inquiry)

Thanks
jerryp
(An associate ARRL member because
I have never bothered telling them
I got my license)

I saw a few posts a week or so ago about problems with the Alinco 580T.
Were there any conclusions regarding bugs or problems with this model?
I just bought one and am happy with it, but I want to know if I should
be aware of anything in particular. The only possible bug I found was that
when I'm running it off DC in my car the handheld gets rather hot, almost
to the point where I can't hold it.

as an additionaly data point to this thread. i just purchased the model
815b swr bridge at the Oklahoma City Hamfest. had it sitting in the box
until last nite.

took it out and connected it between the yaesu ft707 and the heath dummy load.
to my surprise my dummy load suddenly has a swr of 2.0!!! connected up
the daiwa swr meter and the swr was 1.0, as expected in the first place.

took off cover (mfj), adjusted trimmer cap and got the meter reading correctly
on both the 200 and 2000 watt scale. then proceeded with the original mod
i planned to use the swr meter for in the first place. jumpered across
the 10k resistor on pot2 (HI position) to get sensitivity up for qrp work.

best i was able to do was 10watts full scale. no more sensitivity left.
back to the drawing boards.

on the quality. i would give it a 3 out of a possible 10. the soldering
looks to be done by a 100 watt iron and leads were not trimmed on the foil
side of the board. for a $89 (list price, $52 at the meet) instrument,
i would have expected better QC. IMHO. may get the w1fb board from FAR
circuits and put in the case and use the meter.

>information you have used to reach this conclusion. I am certain that a
>well-reasoned individual like yourself must have some basis for making
>this otherwise-inflammatory statement.

OK Mr. Hare, I'll clarify this for you. The FCC had proposed the institution of a codeless Technician Class license back in the 1970's...I'm sure you do remember that, right? Do you also remember the outcome? The ARRL was at it's antique-finest in managing to shout-down the proposal; supposedly "the voice of the membership" was against it. Right. As it now sits, the codeless Tech is almost considered a bastard step-child by a large percentage of the OF's and that's *exactly* why HQ's got you writing those cute little stories.

Face it OM, the status-quo is what they know. The ARRL as an organization has a long history of selective innovation, guided always by the New England'ish minimalism mentality...you can't get there from here...not yet..etc. The truth is that this approach is not always the best. A really good example would be the 6 meter band plan:

ARRL being a Conn. based operation, has tended to follow the local setting in arranging the 6 meter band plan to resemble local-usage. There are many repeaters for this band and no commercial television channel 2. Therefore, the top half of the band is setup for repeaters, with the relativly harmless, and fairly low-power RC slice being relocated to 50.1-50.9 FROM 53.1-53.9; a place where higher power operations (SUCH AS REPEATERS) can easily cause TVI in areas where commercial television channel 2 is in use. It would make a lot more sense to move repeater operation down below 53MHz. A quick look at the Texas Six Meter Club's plan, the SMIRK Plan or even the one that the Souther California Six Meter Club has been proposing since 1983 would seem to be a lot more workable for most areas of the US than the one the ARRL keeps insisting on. Sure, band plans are local-option - but the ARRL has completly IGNORED the facts about typical six meter operations OUTSIDE of HQ's little area of the country!

Yes, I did forget the :-), and that was meant in a dishing sort of way...we're all radio-nerds...sort of like a conversation between members of some minority group using a familiar-derogatory term...all in fun..but you have to admit that the minimalistic approach to things is kinda square.

>Just as soon as the FCC actually takes its marching orders from us. Ah,
>persuasion by contradiction. :-).

>many different sources.

Uhuh..like I said...the problem is that the recent actions have been taking place in areas where the FCC Field Engineer is suffering from 'Maytag Repair Man's Syndrome'. In So. Calif. the priorities have been layed out to me by our local OO Chief as follows:

1) Presidential Communications (for), Air Force 1, and 2. The motorcades for same and the various visiting international groups that the SS, FBI, CIA, etal must survey and protect. These frequencies are the FCC's local top drawer. Any kind of irregularities are run to task in real-time and without fail!

2) Air and Marine traffic frequencies (where) safety of passengers is at stake.

3) Police, Fire and emergency response frequencies.

4) Commercial broadcast and business related to broadcasting.

5) Common-carrier commercial interests.

6) ISM and manufacturing interests.

7) Amateur Service, but only in extreme cases.

8) CB, but only where such operations impact Priorities 1-6.

(Well, great! At least we beat the CBers by one notch...or did we?)

>
>The other dead horse I will beat again is that K1ZZ (Dave Sumner) is not
>the one who will make the policy decisions about this type of thing. Policy

>spare as much of your time as you spend writing flames and posts to writing
>a well-reasoned letter to your Director?
>
>Just some food for thought.
>
Yep, I know...being a volunteer is a thankless task. Just like putting up antennas, running nightly nets, teaching kids about radio and whole host of other noble things. The point being these individuals have ASKED to do the job...I would like to think that given a sense of direction and the existing situation or situations, they could more easily accomplish their objectives. ..which I would *hope* include fostering healthy discussion about what we do and why we do it. So far not one of the ARRL staffers have offered a real reason *why* the League insists on code proficiency beyond the ITU regs requirement of 5 WPM...can you answer that for me and this assembly? Please. ..the FCC claims they would be willing to DROP the 13 and 20 WPM tests from the incentive scheme but that the ARRL insists on keeping them.

2136. Kenwood TM732A Review

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-12 20:59:41 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <l8iuttINN9nb@west.west.sun.com>
Source record: 285911

Since there have been a few requests, I have updated the article
and am reposting it at this time.

-fred

First Impressions: The Kenwood TM-732A April 20, 1992

Fred Lloyd, AA7BQ

The TM-732A is Kenwood's newest entry into the fiercely
competitive dual band mobile market. It is designed to replace
the TM-731 dual bander, which in its own right was an extremely
solid performer.

The TM-732A (or 732 for short) is closely related to Kenwood's
other late model radios like the TM-x41 series. I have personal
experience with the TM-241 and the TM-741 and find that there is
a good deal in common between them and the 732. On the other
hand, the 732 does hit the ground running with a few new
features which make it stand out from even its higher priced
brother the 741.

Physical Description

The 732 is the same basic form factor as the TM-2/4/541 series
mono band radios which goes to say that it is an very small
package for a full featured dual-bander. The package is a bit
longer, however due to the small fan mounted on the rear
heatsink. The manufacturers seem to be opting for the fan
instead of the heat sink these days, and my only guess is that
its ultimately cheaper to produce them that way. Nevertheless,
the 732 is _considerably_ smaller than the 731 that it
replaces.

Like the TM-741, the unit features a removable control head. The
control head's release latch on the 732 is nicely recessed on the
left side of the radio making it a bit more secure and less
likely to be inadvertently actuated. The latch clip also seems a
lot more positive on the 732. Also, the inside of the base unit
is covered by an integral black plastic panel which keeps the
base unit's electronics covered when you remove the control head
(unlike the 741 which leaves its guts exposed).

The shape of the control head is somewhat different in that it
is not exactly rectangular in that there is a cutout of about
1.5cm^2 where the microphone plugs in to the panel behind it.
The microphone receptacle, an 8 conductor RJ-45 type, is the

same as that used on the 741 and looks to be an emerging (ham radio) standard, perhaps borrowed from the cellular telephone industry. The receptacle is a part of the base unit, not the control head, and so when the control head is removed it is rectangular except for the cutout mentioned above. (I have found that it is the same connector as that used in 10-base-T ethernet networks :-)

The control head displays both bands simultaneously with the first two digits of megahertz being a bit smaller than the others. The clear front bezel was thoughtfully designed to be recessed a bit, so as to prevent scratches. Finally, there is a nice littel lip on both the top and the bottom of the case that protects the bezel.

The controls have the typical legends borrowed from the 241 and the 741 series. It is disappointing to note that the key legends are not illuminated for nighttime use.

There are two speaker jacks on the rear, one for each band with one that can output both bands. The antenna connectors are typical Kenwood pigtail style with no built-in duplexer. The same mounting hardware and bracket is used as with the TM-241.

A look under the covers reveals an impressive dual-hollowed die cast aluminum case which looks like it could withstand an air drop. The The upper hollow contains the VHF transceiver with the UHF in the lower portion. The speaker is a nice size (about 2") and sits in the upper (VHF) portion of the case. The base unit includes a third circuit board which is attached to the front and is a "mother board" of sorts which contains the base unit MPU and interface connectors. The only other circuit board is the one found in the remote control head unit.

The overall integration of the unit is impressive. My first thought at seeing the inside was that it seemed nearly empty. That's because the surface mounted components are so small and the integration so high that there are only a few visible building blocks present. There are, for example, no wires inside this box. Well, to be accurate, there are the two wires which feed the speaker. That's it. The rest of the connections are all made via printed circuit paths. There is one short, small, green wire in the control head, which when clipped enables extended receive capabilities (see below).

There are a couple of small adjustable pots inside, and these are the smallest that I've ever seen. They, like everything else, are surface mount types. I would guess their size to be on the order of 3mm square! If I were to try and adjust them, I'd probably use the eraser end of a pencil. These pots adjust the high and low power output settings as well as the max deviation.

The unit comes DTMF ready, which means that a DTMF decoder board is included. This gives it remote control ability, DTMF squelch and paging, and a 10 number autodialer. The only internal option offered is the TSU-7 CTCSS (PL decode) board ($50 US).

Operating Features

Kenwood has done a fairly good job at maintaining a consistent user interface between their models. Being familiar with the 241 and 741, I found it pretty intuitive to operate. Not intuitive enough, however, to venture out of the house without taking the operators manual along since they sadly omitted a quick reference card (like the gave out with the 741). Unless otherwise noted, the 732 generally has the same basic feature set as the TM-241 plus several extras.

The following is an unordered list of outstanding bits of trivia regarding the 732's features:

1. Dual In-Band Receive: Competitive pressures (e.g. Icom's 2410) has now made this a standard. You can set the display to receive any combination of: VHF/UHF, VHF/VHF or UHF/UHF. This capability is quite well engineered and makes it possible to transmit as well as receive on either band's second display. It is not possible (understandably) to have a full duplex QSO on an in-band setup. In other words, when you set the radio to monitor two UHF or two VHF frequencies, one of these frequencies is muted when you transmit on the other. This is not so when the selection is VHF/UHF, where the receiving band is not muted during transmit.

Looking at the schematic, the dual in-band receive is well implemented with each of the transceiver boards having two receiver front end units (RF amp and mixers), one for each band. There are some unsymmetrical aspects to the dual in-band receive. First, the UHF receiver does not have an AM mode which means that you cannot monitor AM aircraft spectrum at 118-136 MHz with the UHF receiver. Similarly, you cannot monitor 800 MHz with the VHF receiver. Each of these modes AM aircraft and 800 MHz, are unique to the VHF and UHF receivers respectively.

A nice touch is that even though the second receiver is utilized on the other band, the transmitter is automatically switched back to the proper band which allows you to transmit on either of the two frequencies while using the dual in-band mode. In this way, it really feels like you have two radios on the same band.

2. Smart Mute: The MUTE function is now intelligent in that it mutes the non-PTT band only when necessary. This means that the audio muting (actually, 20Db of audio attenuation) is switched into the auxiliary band only when something is being received on the primary band. Previous Kenwood rigs muted the auxiliary

band at all times when the MUTE function was active.

3. More programmable microphone function keys: Previous Kenwoods allowed you to program the PF microphone key only. With the 732, you may program any of the top 4 function keys (CALL, VFO, MR and PF), even for example, with such multi-key sequences as [F][VFO].

4. New Display Lighting: The display is the now-standard black letters on a light background. Like the 741, it has 4 light levels, plus OFF (no light) which is nice. Also, there's a special feature which when enabled makes the display jump up to the next brighter display level whenever a button or key is pressed, returning to the dim level after 5 seconds of inactivity. When used with the OFF level it gives you a display which is completely dark at night and comes on only when you need it. There is, however, a small green LED off of the display which remains lit at all times to show which band is in use.

5. Memory: As advertised the radio comes with 25 full-function, odd-offset capable memories per band for a total of 50 memories. What's nice however, is that you can have up to 64 memories if you are willing to forgo the odd-offset capability to varying degrees. For example, if you can live with only 5 odd-offsets then you'll get 30 memories per band. If you don't need any odd-offsets then you get 32 memories per band. In addition, you can apportion the 64 available slots between the two bands in whatever ratio that you desire (in 5 channel increments). In other words, you can configure for 50 UHF memories and 14 VHF memories if you like.

6. Cross Band Repeat: This is the first Kenwood radio to come from the factory with CBR enabled and documented - no mods necessary. Works in the usual way and has a built-in adjustable time out timer. The turnaround hang time is also adjustable.

7. Full remote control from microphone: There is a special mode in which nearly all functions are controllable via the keys on the microphone. Even volume and squelch are controllable. The key sequences are difficult (although no more than others) do memorize. Where's my cheat sheet !?!?

8. Remote base operation: The radio is remote controllable via another transceiver using DTMF tones. The key sequences are not the same as those used for the "microphone remote control" as mentioned above. Nonetheless, it is possible to change frequency, PL, Repeater ON/OFF, memory channels, etc. from remote. Determining your current frequency from remote base is only indirectly possible, and then only if you've got a perfect pitch ear. You can command the radio to "speak" its frequency in which it will emit one of ten documented unique tones for

each digit in the frequency display. ICOM solved this in the 2410 by including a Voice Synthesizer option which will really "speak" the current frequency. There is no way to determine any other operating parameter via remote control. You must set what you want.

9. Channelized Operation: Using this mode, frequencies are no longer displayed and the VFO is deactivated. Only memory channels are available for use and the display shows CH-01, CH-02, etc. An unusual feature in my opinion. It would allow the radio to become an instant business-band unit if it only had the type acceptance.

10. New Squelch Features: The unit essentially has 3 squelch modes (not counting CTCSS or DTMF). There is the normal noise activated squelch and two new squelch modes - S-meter squelch and Microprocessor squelch. S-meter squelch works on signal strength instead of noise level and when it is used you preset a desired S level on your S-meter using the squelch knob. Only signals which are stronger than your setting will break squelch. The other new mode, Microprocessor squelch, is basically a full automatic squelch which disables the squelch knobs entirely leaving the internal CPU to do the work.

11. Dual band simultaneous scanning: Not particularly new but a nice feature anyway. You may continue to scan on one band while you're talking on the other. The ability to do dual in-band scanning has not been tested but should be possible.

12. Extended Receive Modes: Cutting the now famous green wire in the control head will unlock the UHF receiver which comes factory limited to 438.005-449.995. After the mod (which requires no radio disassembly) the UHF receiver will cover from 410-570 MHz. Also, an 800 MHz mode is available by pressing and holding the MHZ front panel key. To enable 800 MHz receive, a capacitor must be installed under the UHF receiver. (See the separate article on TM732 MODS for the full info).

13. Memory Cloning: Take two 732's and you can exchange their memory contents either by wire or _over_the_air_ using DTMF tones! This capability is documented in the TM732.MOD file.

Subjective Impressions

Being a TM-741 owner, there were a couple of things that I missed on the 732. First, there's no real-time clock, no sleep timer, no programmable ON time/ OFF time feature. There is an APO (automatic power off) with a preset time of 2:59:00 of inactivity until power down.

Another complaint is the slow scanning speed. The unit will scan VFO or memory at no more than about 5 channels/frequencies per second per band. I consider this to be terribly slow in today's

age. The slowness is probably due to the fact that the remote contains all of the scanning logic and because the data path between the head and the base is over a 2 wire serial data stream.

Another perennial complaint is that the radio does not cover the entire UHF frequency band of 420-450 Mhz. As shipped, the unit will only operate over the range from 438 to 450, (transmit or receive) which I find objectionable. In the US, we hams _are_authorized_ to transmit anywhere between 420 and 450 MHz!

The manual is of typical quality and fairly complete although not well indexed. There are so many functions that a cheat sheet is needed but as mentioned, was sadly not included. In typical fashion I note that the Japanese have never been able to adequately and clearly explain how DTMF Squelch and Paging works. They've tried diagrams and jinglish explanations but in the end you still end up reading the instructions over and over before you fully understand them. I'd love to see a plain English discussion of how the DTMF features are intended to work and how they really work in practice. Follow that with a step by step example and we'd probably have something that could be more popular.

One of my reasons for buying the radio was to use the remote mounted head option. The option, the PG-4K kit, is advertised as a 13 foot extension. What you don't find out until you buy it, however, is that only the display cable is 13 feet long and the microphone cable is only half that! To me this meant that although the display cable would let me trunk mount the base, there was no way I could get by with a 6 foot microphone cable. The solution: buy the PG-4M(?) which is the longer model for another $30! Needless to say, I'm not a happy camper! Are you listening Kenwood???? (Yes, they have been listening, and I understand that they have changed this -fred)

On a positive note about the remote cabling, at least with the 732 it is possible to roll your own. The 4 conductor head to chassis connector cable could be easily spliced and extended, and an ordinary RJ-45 extension cable could be used for the microphone. For many folks, however, it's probably easier to just buy the short ($47) or the long ($78) cable kit.

The extension cable issue aside however, it still looks like it will be a very good radio. As always, after spending a big wad of cash I'm automatically inclined to say that I like the radio. This is no exception, the TM-732 does a fine job at heading off the competition at a good price-performance point. The price is the same as the older TM-731 which was around $650 retail (real price, not the bogus MSRP).

To conclude, I think Kenwood has come up with a fine replacement for the 731, and has put a lot of thought put into the design of the 732.

See you on the air...

>end all is a monstrous array at 100 feet or a 20 acre rhombic.

But the be-all to end-all IS a 20 acre rhombic. Kicks the bejuzus out of
anything else, and is inherently broadbanded in it's terminated version
(resonant rhombics are a different matter). All you need is 4 poles,
wire, a termination, and something to feed it. None of the nastinesses
you get with yagis, though the rhombic has a few nastinesses of it's own
(they're awkward to rotate :).

I'm waiting for the antenna book to have a good discussion of Webenwullers :).

I have not heard a station signing 9D2RR, perhaps it was reported incorrectly. The correct callsign is 9D0RR, both CW and SSB. Yes, it is Romeo of XY0RR fame, etc. As with most DXpeditions, final 'legitimacy' is determined by the DX Awards Committee, and depends not only on obtaining a valid license, but actually showing proof of entry to and exit from the country. No doubt Romeo has this permission, he has been good about this in the past. Ed, NT2X (Romeo's liason in USA), has had no negative reaction to the expedition. However, as with all DX, work first, worry later.

2140. FT-470 Mod Fix - sniffer !!!!

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-12 22:17:24 UTC
From: rabassa_ao%ncsd.dnet@gte.COM
Message-ID: <9208122200.AA18964@bunny.gte.com>
Source record: 285918

Carl, hayssen@sceng.ub.com

If the factory mod fix requires a change in the IF frequency,
a couple turns of wire and a general coverage receiver should
be enough to verify the frequency change.

Wrap the HT with about 10 turns of insulated wire around the
case. Connect this to a piece of coax connected to the receiver.
With the HT on, enough signal should leak out to be detected
as a tone in the SSB position. Tune to the old and new IF
frequencies, and listen. You will hear the osc. singing !!!!

A freq counter lacks sensitivity, but a GC receiver with -120dBm
MDS, works just fine. The S-meter reading may be only
S1 or S2, so do not be alarmed. A shielded osc is not very
strong. This may be of some help.

So, keep the case on, close your eyes, and use your ears.

9D0RR is definitely Romeo. I have worked him on both CW and SSB, I suspect the 9D2 callsign is bogus. Accreditation by the ARRL DX Awards Committee depends on many things - not just obtaining written operating permission, but also having proof of entrance to and exit from a country. No doubt Romeo has all these things, he has been OK in the past. Ed, NT2X (his liason in US) does not have any reservations about this operation. However, as with all DX, work first, worry later.

I prefer non-resonant, un-terminated long wire antennas. Especially Veebeams. Veebeams are better than rhombics because they are smaller, more adjustable, and a rhombic is really just two veebeams anyway. My old veebeam blew down but I'm currently getting ready to put up a 3 leg thing with a switch box to select one vee, another vee, or wide vee, all feed by one 450 ohm ladder line. This will effectively constitute a bidirectional Wullenweber I hope.
>
>I'm waiting for the antenna book to have a good discussion of Webenwullers :).
>
A Wullenweber is any arrangement of directional antennas designed to be selected electrically so as to provide a rotating beam sorta like radar. Picture this:
A 200 foot mast with sloping veebeams running in all directions which are terminated near the ground. A mechanical or electrical switching arrangement at the feedpoint is constantly rotating the pattern forming a shortwave rotating "dish" antenna. Several of these around the country should be able to pinpoint any station's position by triangulation and will be broadbanded so as to cover most of the hf spectrum. An antenna like this is described in a 1947 issue of QST, I believe.

I understand there is a shareware or public domain version of the "Surfer" software that many use to plot 3-dimensional representations of digitized terrain data. (Application: (1) take 3 or 30 second database; (2) extract data of interest; (3) plot using software such as Surfer [3-dimensional modeling product].) The big question: Anyone know if there is such a product (other than the $500 Surfer product that no one seems to discount) and where it might be found? Rumors persist that such an item is available. Comments?

Dave,
Check the filter capacitors in the HV filter. These go bad quite frequently. They may be breaking down at some voltage considerably higher than your ohmmeter will supply, so the best thing to do is replace them. If that doesn't work, you MAY have a short in one or more turns of the HV secondary. Shorted filter caps can acuse this also. I'm assuming that you've checked the supplies feeding the oscillator... Best of luck!!!

Steve Pazar

The FT-470 *does* have this feature.

> Alinco and Yaesu have much cheaper accessories than Kenwood and Icom.
>Example: 12V battery packs ~$65.00 for Alinco and Yaesu, ~$90.00 for Kenwood,
>and ~$100.00 for Icom's low-mAH rated packs.

On accessories, Icom (not all), Alinco, and Yaesu accessories will work on each other's rigs. Things like headsets, speaker-mikes, etc. Battery packs aren't interchangeable, but much cheaper ones for all three are available from third party vendors. Kenwood is, as usual, odd man out here. None of their items will work with the other radios, and battery packs are harder to get at a good price for the 78.

> If I had the money, I would buy the Kenwood. The Alinco is the best
>bargain (price vs. features). Icom is noted for their customer service, very
>quick turn-around time for repairs. While the FT-470 has just been around too
>long.

Another way of phrasing that is to say that the FT-470 is the most proven and largest selling of the group. It's also user friendly, rugged, and cheaper at current discounts. It's not without it's faults, and a new model is rumored to be coming out next month.

Note that most of the trumpeted features of the Kenwood won't see much day to day use and are mainly marketing gimmicks. The Kenwood doesn't have a very good reputation for reliability either. Neither do the new small Icoms for that matter. There's currently a recall in progress on one of the Icom radios. For sheer reliability, the IC2AT, IC2GAT, and IC32AT are tops. They're big, with big batteries, but you can club a mugger unconscious with one and then call it in. Only the FT-470 even *approaches* this degree of ruggedness among the current crop of radios.

Think carefully about what qualities you *need* in a radio for day to day use before making your selection. A HT is not a good substitute for a scanner, and wideband scanners generally make lousy HTs. The things *I* rate a radio on are, reliability, ease of use, battery life, and basic ham band performance. I don't care if it can play Space Invaders on the LCD or listen to cellular phone conversations. As far as memories go, the IC2AT has all the new radios beat with it's 800 *mechanical* memories.

I heartily agree. I've owned a Standard C628A (dual band 450/1200)
for several months now and it's a FINE radio. I'd definately give the
C528 or the later model (I forget the number) a look.

FYI... if you're into covering the ENTIRE ham band, my C628A does
quite nicely from 420-450 MHz. Quite a nice piece of gear for working
on link radios...

>Gamma vs. T match.

While it seems reasonable that since coax is unbalanced, an unbalanced
matching system would be best, it's not usually true. Depending to an
extent on antenna physical construction and feedline routing, the T match
almost always gives better current distribution in the driven element and
almost always reduces undesired feedline radiation. If you look at commercial
VHF/UHF yagis, the best ones generally use the T match while cheaper ones
use the Gamma. Cushcraft uses the T on it's boomers and the gamma on it's
lower performance antennas. KLM uses the T. At HF, the difference doesn't
seem as important and many good beans use the gamma match. Other issues,
such as feedline routing, mechanical design, mounting methods, and antenna
placement usually will play a bigger role in antenna performance than
the matching method. Given that, I will say that my experience has been
that the T match is superior at VHF/UHF.

>I seem to recall reading in my study guide for the novice test,
>a question about the bandwidth for communicating with an"unspecified
>digital code." What exactly did they mean by this?
>
>jab0684@usl.edu

The FCC uses several methods for relating digital modes to bandwidth. Traditionally they have relied on standard encodings with standard speeds given in WPM and standard FSK shifts. With the rise of other digital encodings, they started talking about "baud rates" in the rules. For example HF packet is limited to 300 baud. Now that's not too satisfactory given that modulation methods other than FSK have appeared. Now bits per second and baud may not mean the same thing as modulation methods have been developed to encode more than one bit per baud, QPSK is an example. So the FCC got down to where the rubber meets the road and said that occupied bandwidth is the only important criteria from a rules standpoint and started specifying maximum bandwidth and letting you fill that with any encoding you like. Unfortunately, they didn't delete the older rules at the same time so now we have a confusing mismash of conflicting rules on what and what isn't legal.

There's also confusion between bit encodings at the machine level, Baudot, ASCII, EBDIC, etc, and bit encodings at the modem level, FSK, PSK, QPSK, MSK, etc. Because the FCC didn't seem to have a really good grasp of the fundamentals involved, their early rules are anachronisms. This is an area of the rules that needs revisiting.

>four of them ICs. Now really - isn't that a bit much?

Have you looked at the cooling fan Sony uses on the BVW-75? It uses 3 ICs
including a *microprocessor* and 6 FETs for a constant speed brushless fan.
Is that overkill, maybe, maybe not. It does seem to last better and produce
less hash.

>The best designs are equally artistic and scientific.

There *is* an esthetic to design. I tend to like designs that are
elegant in that they do a lot with a little. On the other hand,
there are times when I prefer the nuclear engineering approach of
"I believe in the lever, I believe in the inclined plane, the
wheel I'm not so sure about." Conservative brute force designs have
a certain appeal.

There's an old adage that to the man with a hammer everything looks
like a nail. We see this trend a lot today. Circuits that would be
simple to do in analog are translated into digital and a microprocessor
thrown at them. That's how we wind up with radios with horrible phase
noise and Nintendo games on their digital display. There's a certain
elegance to a HT200 that's missing from today's digital scanners that
try to masquerade as *radios*.

On the other hand, DPLL and DSP designs offer things that are impractical
to achieve in analog technology. There's a tradeoff between hardware/
software that can become a slippery slope of despair for the harried
designer whose toolbox has only limited techniques to offer.

Congratulations for deciding to use a Motorola antenna -- I think they are the best! (I have no affiliation with Motorola)

I would suggest the following for *punching* holes in roof tops, whether you use a drill or punch:

* Mark off the area with masking tape, forming an *operation area* of about 3 in sq.
* Use paper towels, taped down to extend the operation area, followed by some towels, to rest tools and drill(s).
* After determining THE spot, use a small punch to make an indentation for drilling.
* If you can't remove the headliner, lower it so you can slip a sheet of aluminum, pc board or plastic sheet between the roof and headliner. This will prevent the drill bit from puncturing the headliner and catch metal shavings from drilling.
* After drilling, carefully vacuum the metal shavings, before they mysteriously wind up scratching the paint.
* Make sure to scrape or remove paint/undercoating around the bottom edge of the hole to ensure a good RF ground. THIS IS THE PART MOST PEOPLE IGNORE. Use dental tool scrapers, if you have to work from the top side only. MAKE sure there is bare metal for the teeth of the antenna mount to *bite*.
* With Motorola's o-ring, I find that RTV is not needed. However, I do apply transistor type silicone heat sink compound in the area of the o-ring.

Good luck -- take your time and go slow. When drilling, keep a high rpm and use light pressure to minimize warping and abrupt punch-thru.

>handheld that has this feature? or is it unique to this radio?

The Standard line of Dual Band HT's C228, C528 and C628 has this feature.
It may be in their single band units as well.

In many other rigs it is not hard to do manually, if the PL decode in the
rig will work while you change PL freqs.

>
>73 Dave G7MIL

The back of the unit is equiped with high efficiency solar cells and can
recharge its battery pack if exposed to high light levels. It has a
built in cw-identifier that works in cross-band repeat mode. The
combination of features allows the unit to be easily used as hamsat.
Getting it into orbit is your problem ;-).

Kidding aside, there a few things left to add, but something has to be done
to increase the usability of the features they already have. Its always
going to be hard to lay out the features logically, yet keep the most
commonly used features handy.

Time to join the fray.

What happened to the Orange covers?

But seriously, some thought should be given to getting the League (Yes, I support keeping the name the ARRL) to get it's manuals and books in order.

I know, its a difficult task considering the major changes that have happened in the past twenty years. But it would help the image a bit when you look in the Handbook and under the heading "Digital Communications" it didn't have a picture of a Teletype (tm) Model 15 as the state of the art.

The antenna book could use some help too if it didn't act like the be all to end all is a monstrous array at 100 feet or a 20 acre rhombic.

QST used to cover a WIDE variety of subjects. Remember when Television was THE new thing? Also radio controled models? Surplus gear conversions. I know, things have changed. There aren't anymore pallets of ARC-5 radios laying about. How about some articles on ISDN and how it applies to amateur networking? How about how to get DXCC (if you really must) with 100 watts and a dipole? How about articles on working public events without appearing as a wannabe-cop?

Yes, I remember QST from quite a ways back. Most of the other mags as well. I've seen a LOT of changes in the hobby. There is no reason why things can't progress and stay in touch with the way our world is today.

HI !

I'd like to buy a Kenwood TS-450S and would like to know
if there's a possiblity to modify the RX and TX range of
this transceiver. - I would wonder if you couldn't modify
this rig to TX all over 150kHz up to 30MHz.

Any information welcome.

73!, Pat, DD6PF.

2165. ICOM IC2-GAT QUESTION

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 11:11:55 UTC
From: kstuart@oasys.dt.navy.mil
Message-ID: <23573@oasys.dt.navy.mil>
Source record: 285849

Has any owner of an ICOM IC2-GAT out there performed an adjustment for deviation level of the DTMF tone generator? It seems that mine is just a teeeeny bit too low for my favorite repeater to grab. Normal speech deviation is fine, so all I have to do is tweak the gain pot on the TT board.

However, the owner's manual for the rig gives no info as to where the pot is located, how to get to it, etc.

Before I spent lotsa bux at the local candy store for a maintenance manual, I'd like to see if any of you can give me the info I need.

Thanks in advance.

>(Well, great! At least we beat the CBers by one notch...or did we?)

....I've just read this list of priorities, and I have to say I agree with it. Why should a free service (ie, Amateur Radio....remember, we don't pay any fees for licenses) get priority over national defense, or even commercial (ie, paid) services? So, I guess I missed the point that Mr. Sargatz was trying to make.

I also can't figure out how namecalling in public is going to get him any more support.....but I'll stay out of that discussion. I lose interest when people stop being logical.

Some time ago, I asked a similar question of a VEC. The reply was that anyone (not otherwise prohibited) could hold a license. The ONLY place that ham exams COULD NOT be given, though, was inside a penal institution.

Whether or not a person holding a license before incarceration could retain it, wasn't clear.

BTW, for the WAP award, would it have sub-categories depending on the level of security; i.e. honor farm, "country club", work release, minimum, maximum, etc.?

2170. RS-10 on 10m

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 13:44:07 UTC
From: mancus@norm.jsc.nasa.gov
Message-ID: <1992Aug13.134407.7413@aio.jsc.nasa.gov>
Source record: 285854

Last night I attempted to tune in RS-10 for the first time. I had
a number of problems and no conclusive success. Any help or suggestions
would be appreciated. Note that I was attempting to receive only,
particularly concentrating on the beacons.
The Rig: Uniden HR-2600 (no filters, sad to say)
The Antenna: CB vertical whip (magmount) cut down for 10m
The Ground: A metal foldup chair sitting in my apartment

This may sound pretty lame, but I have used the magmount-and-chair
method for all 2m operations with good success, and have received 10m
packet from very long distances with this same 10m rig and antenna.
(I can't transmit packet with it yet because of some oddball connectors
I haven't dealt with.)

Problems:
Around 9:30pm CDT I started monitoring the RS-10 beacon frequency
29.357 MHz. To my great surprise, there was a continuous tone there,
although the satellite was not due to rise until after 10pm. I checked
back on this frequency every so often throughout the RS-10 pass, and
there was always a strong signal here. It was difficult to say if it was
shifting due to Doppler.
I never heard a distinct CW signal anywhere in the passband. I *did*
hear some USB speech up above 29.39, but the SNR was so low I couldn't
hear what was being said. The S-meter never showed any significant signal.
So, what is wrong? Do I need a rig with better filters? Is my antenna
too much of a joke? I live in an apartment, so there are serious limits
to the possibly deployable antennas. Or would just getting the antenna
outside make a big difference? I could move the chair out onto the
second-floor patio pretty easily.
I have also listened to the NOAA and Meteor birds pass overhead by
slapping the 2m magmount on the roof of my car and plugging it into my
FT-470. These show as nearly S9 for most of the pass. Of course, this
is not the same antenna, and it *is* outside.

|>Thanks,
|>Bryan Welch
|>N0SFG

Don't know about the antenna.

As for mounting it: definitely go for a punch (such as Greenlee) if at all possible. Buying one is a LOT more expensive than your antenna, though! I managed to borrow one, which was wonderful. Failing that, unless the hole is quite small, go for a hole saw. Drills produce 3-sided holes when drilling in sheet metal.

Sealing: I used a Larsen permanent mount (for NMO, 3/4 inch hole). It comes with an O-ring, and I just used that. Never a problem. If you have a smooth surface and a mount that comes with O-ring seals (and the O-ring is in good shape; replace it if in doubt) then that should suffice. If not, then silicone is probably the way to go. In that case, I wouldn't use wax, since I wouldn't trust silicone to stick to it. Instead, remove any wax, grease, etc. (When I want to make REALLY sure things are clean, I start with alcohol, then switch to acetone, or if really paranoid use xylol or laquer thinner (i.e., toluene -- not to be confused with paint thinner) in between. Don't use it on a large area, since it may take the shine off the paint, but there definitely will NOT be any crud left after you do this...)

In article <1992Aug12.134847.29114@ucselx.sdsu.edu> palsson@ucselx.sdsu.edu (Jerry Palsson) writes:
>Julian's points about "destinated" are well taken, but he really
>shouldn't cite the OED as a reference source. The fact that "destinated"
>appears there is irrelevant to its current usage. The OED is a
>wonderfully rich record of words that have been used in the English
>language, and as such it contains many words that have been dead for
>decades (sometimes centuries).

Shouldn't cite the OED? Can you then suggest a better reference of the words of the english language? I have several dictionaries available to me. But when I really want to see the usage and history of a word, I eat my spinach and reach for my OED. It is a pain to use, but really gives me the answers I need. When I figure out how to get a CD player running on my evil Sys V machine, it will be for the CD ROM OED.

But despite the fact that a word appears in the OED, and lets face it they all do, does not mean it is archaic or obselete. Any good God fearing Presbyterian will understand the word destinate. That is why an earlier poster talked about "Are you going to heaven or hell?".

So to satisfy the pedants and unbelievers, here is a reference from a murrican dictionary. Websters Third New International Dictionary - Unabridged. by G & C Merriam Company, Publishers. Springfield Massachusetts. 1963

1 destinate [ME, fr. L destinatus, past aprt of destinaire] 1. archaic : ordained by fate 2. set apart for : intended

2 destinate [L destinatus, past part] 1. archaic a: DESIGNATE b. DOOM 2. archaic : to predetermine as an act of fate by divine decree 3 archaic : to design or intend

Before anyone jumps on me and says "Well it says archaic so there", note that not all of the usage is arcaic - just most of it. And I bet I can dredge up a user of it in the arcaic sense in only a phone call - my mother for a start. But then my mother has an excellent command of the English language. So now someone will probably say that you can't use a verbalist as a reference for usage but only an illiterate peasant with a 300 word vocabulary.

>I don't like the word either, but Fred Lloyd's comments about usage
>eventually determining correctness are right on the mark.

But then it is also up to all of us to point out incorrect usage and keep the language concise. Unlike the French and other European nations, we don't have a committee of geezers pontificating

on usage of words and grammer. We can use "savoir faire" with no guilt,
but the poor Froggies have been officially denied "le know-how". Guess
what their committee for the correct use of french told them to use
instead of the franglais "le know-how" - yes, "savior faire".

Anyway, I know I'm destinated - hell is where I will go. I will
then get to consort with Sir Compton McKenzie and other debauchees

>andy (pitonyak@cis.ohio-state.edu)

That depends on what you mean by direct. Putting a T connector
at the transmitter and connecting a 10 meg probe to a 1/4 inch
long wire stuck in the center hole isn't going to change your loading
very much, particluarly if you can "tune" the transmitter. It might
affect received signals slightly because of the mismatch caused
mostly by the T and the probe capacitance. I doubt that you would
ever know it though.

I use the indirect method. Wind about 5 turns of wire around your
largest finger to get a coil. Stick one end of the wire in the
scope input. Solder the other end to a resistor, 1K to 10K
depending on the scopes input impedance and sensitivity as well
as the amount of RF in your shack. Connect the end of the
resistor to the scope ground. You get wildly varying amounts of
signal on the different bands with this approach, but that's what
the vertical knob if for. K9ALD

2175. Re: RS-10 on 10m

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 14:27:51 UTC
From: awinterb@diana.cair.du.edu
Message-ID: <1992Aug13.142751.4899@mercury.cair.du.edu>
Source record: 285857

I've listened to a few of the RS-10 passes in the last couple
of weeks. The rig is an ancient GPR-90 boat anchor (made about
1957 or so) and a wire wrapped around the ceiling (20 meter
halff wave). I also operate from an "indoor" environment. The
signal was S-6 at peak. However, when I switched to the
Isotron "dummy load" antenna, secreted away in a hidden spot
on the roof of the townhouse, with about 50' of coax to it,
the signal went completely away. So, in this case, a good
indoor antenna (untuned!) was superior to a marginal outdoor antenna!
I heard no tones on the beacon freq here (Denver). But, make
sure your xtal oscillator frequency standard is turned off!

>this...

It would be difficult to to prgramme a repeater to block DTMF.
The gimmick with touch tones is that they are "in band signalling". In english that means they occupy the same bandwidth as regular communications voice. Now, I will concede that the bandpass can be tilted so badly that speech will sound like a Jethro Tull record. In that case the DTMF level between the tones may be too great to be decoded reliably. This disparity of levels between the two tones is called twist. Bear in mind that if the band pass of your local repeater is that buggered, comprehension of voice will be pretty low.

In short, repeaters pass DTMF fine - so do telephone lines. I once had a hilarious conversation with a British Telecom executive about DTMF (MF in their parlance). He claimed they would not guarantee to pass DTMF end to end. Since then of course, the Brits have adopted DTMF enthusiastically. Haven't heard it on repeaters there though, although I know of no regs against it.

For six months at the Soviet Space Exhibit in Fort worth we used a R7 on a tripod, mounted to a sheet of plywood. The Plywood was held down by four bags of sand from the Home Depot. We had some storms with 50mph winds and it stayed up there fine.

We had to come up with a way to mount it with out placing any holes or supports into the roof at the convention center. It worked great, no complaints from any of the dozens of operators, and thousands or stations were worked.

Source record: 285858

I wouldn't expect to hear RS-10's downlink with a whip inside my house--it's pretty weak. I use a TH-3 at 35 feet and while it works fine, the S meter rarely moves. Moving the ant. outside will help, no doubt.

If you've got a steady signal on 29.357, it's not RS-10--probably a 'birdie' in your receiver. I've got one at 29.412 (in the RS-12 passband). The beacon sends "RS-10" and a bunch of status stuff on CW that you can monitor if you really want to know what mode the bird is in, if it's healthy, etc.

Anywho--it doesn't take much to hear/work RS-10, but I think it will take a little more than what you described.

The "Antenna book" is really pretty good. I would like it better if instead of just showing you pictures of the various types of antennas, it would actually show you how to design them. As examples, look up a caged dipole, or a trap dipole using wound rg-58 coaxial cable traps. They have pictures, they tell you how great they work, but no information is presented on designing one (or building one for that matter).

The best tool for drilling an antenna hole in a car is one made for the purpose. The Motorola antenna tool is superb - it starts with just a centerpunched dimple, drills the pilot hole, then saws out the 3/4" hole, and polishes the paint off the perimeter of the hole so that the NMO mount makes good contact, all without snagging the headliner - and all in one operation!

$25 when I bought mine a long time ago.

Your local two-way shop probably has one. Perhaps they'll let you borrow it, or maybe they'll do the hole for you for a nominal fee.

Otherwise, use a Greenlee punch. You'll wish you had.

The "CB linear" amplifiers I'm familiar with (from 20 years ago, when a company I worked for was shipping 3,000 a month) use two transistors in a push-pull circuit. The input and output are ferrite transformers - couple of turns of teflon hookup wire through some brass rivets soldered to two pieces of circuit board. There are tuning caps at both the input and the output to fiddle out component variation and stray capacity, but the amp really isn't a tuned device.

Although there isn't any static bias, they are self-biasing and run class B or thereabouts. If not overdriven, they are really pretty good and will amplify an AM signal without significant distortion. If you overdrive them (more than about 5 watts in) they'll spew chunks.

An Argonaut could drive them to 100 watts on 10 meters, and with a fan on the amp heatsink, I was able to get 500 watts out on 40 meter CW.

I still see them at the swapmeets. Apparently they're quite highly valued.

That company later went on to design and sell the only CB Linear featuring a 4CX250 in it. 500 watts of AM output (claimed). I dunno how many of THOSE they sold - I'd changed jobs by the time that one hit the market.

Instead of arguing about angels dancing on pinheads, why not TEST it?

Nearly all colour monitors have enough "radiated" magnetic field from their sweep circuits to be heard if the phone's receiver and/or network coil is close enough to them. A few have adequate magnetic shielding or are designed to confine the wasted magnetic fields.

Here's how to figure it out for your monitor:

Just pick up your phone, dial a digit to break dialtone, and with the receiver to your ear, lean towards the monitor. When you hear AC hum in the receiver, you've got induction.

For example, the 19" colour monitor on my Sparcstation here at work doesn't induce hum into my Ericsson phone until it's about an inch from the screen.

Paranoia about the magnetic fields' biological effects is left as an exercise for the reader.

I would try and find a ham in town who has a hole saw for drilling holes
for the Motorola mount. Barring that you could go to a two-way radio shop
and see if they'll do it for you.

I purchased my hole saw from HRO about a year ago. It's one of those tools
that you don't use very often but when you do you're very glad you have it.

PERSEID OBSERVATIONS BY RADIO URGENTLY NEEDED

Now that the peak of the Perseid shower has ended attempts are being made to determine what activity levels really were like. I have some visual results but have not receiveed any results from any radio amateurs/ham operators. I would be VERY interested to hear from radio operators who observed the shower what the activity was like - even qualitative impressions would be useful at this point.

Indeed. I almost suspect that that "Dawg" on HF is different person from Mike Whately, WRC-TV cameraman who frequents some local Washington DC repeaters on 2m and 440. We've had a number of friendly discussion on several subjects (at least once we get past the re-introduction stage :-).

By literature and entertainments standards, Mike is pretty tame. The fact that he's still on the air indicates that he's more of an annoyance than a threat.

2191. Re: Help with QRP.

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 18:58:56 UTC
From: turner@safety.ics.uci.edu
Message-ID: <2A8AB0F0.689@ics.uci.edu>
Source record: 285864

Such a general question about QRP operation is really hard to answer, except in generalities.

I personally have backpacked into remote areas with radios. I have really enjoyed the experience. I have frequently taken VHF / UHF handies with me with a twin lead J-pole and set up in relatively high places, and done quite well, even from "remote" locations. However, VHF and UHF will NOT get out of valleys when you are far from repeaters. (There are ways to do this, but they involve a lot of complications, like satellite transceivers or cross band repeating HT's hung on a nearby hill - usually not the sort of stuff you want to do when wilderness backpacking.)

I have also taken HF, and had a real ball. This can take up a bit more space and battery capacity, but solar power with rechargeables is a real option for QRP rigs. I usually take an Argonaut with a lantern battery (probably about 7 + pounds) in the bottom of my backpack. I carry an antenna tuner, a length of 300 ohm twin lead and a lot of thin wire with nylon cord to attach it to trees or rocks. If you want to go out for more than a week without re-supply, you need to have a large capacity backpack to fit it all, and you need to be in good shape (or moving slowly) to carry the extra pounds. I usually move slowly, and take my time in finding good sites to camp at. I have been really successful working 80-10 meters SSB from my tent, sometimes being called a "liar" because people won't believe that I am really a backpacker camped out in the wilderness running 5 watts with a long wire. That's OK as long as I have a reasonable QSO otherwise!

I have also taken smaller CW only rigs for 40 and 20, like the old Ten Tec PM3A. You can find these cheaply at hamfests, and they work fine. You can easily remove them from their cabinets and make them smaller and lighter.

Commercially, MFJ makes the rough equivalents to the above, somewhat improved, I am told, but you will pay over $150 for a kit. It is well worth it though, if you will do a lot of QRP / portable work, and/or if you like to build things.

I would advise you to pick up a copy of QST, look through the ads in the back for rigs and stuff, and you will find several QRP parts / kits suppliers. Write to them for catalogs. If you become really interested, and want to band together with fellow QRP'ers, there are a couple of active clubs where the members do stuff like this all the time. I belong to one: the QRP ARCI.

Good luck

John:

I am originally from Richmond, KY and was recently in the area.
The information Tim posted is correct also there still technically exists
(though not very active) the Wilderness Trail ARC in the Berea area.

Some repeater frequencies in the Blue-Grass area are

146.715 Berea
146.82 Irvine
146.76 Lexington
145.45 "
145.49 Nicholasville
147.12 Winchester
147.33 Mt. Sterling
146.91 Morehead
146.97 Stanford
147.24 Frankfort
146.61 London
146.88 Somerset

There are a few others around, but I can't remember them at the
time. These are the main ones that I used. There are also a couple of
link repeaters to the 145.19 system in Ohio. One is 145.17 near Stanford
and the other is 145.29 (I think) in Lexington.

Someone will be around on one of these to give you more info. Have
a good trip there.

What? The type of punch being discussed is the type made by Greenlee,
often referred to as a "chassis punch." The beauty of a good chassis
punch is that it *WON'T* warp the metal and leaves a very clean hole.
(You first need to drill a 3/8" pilot hole.)

A toothed hole saw will cut an elliptical hole unless it is held
perfectly perpendicular to the surface.

Using a chassis punch is a manual operation, and it's much
easier to control.

I've been installing NMO mounts on cars for almost 20 years using
a chassis punch -- never a problem.

I too dropped my W2A, from about 3 feet...works fine, but scratched the front of the case and cracked the battery rail. Which brings up another point. How come every form of consumer electronic portable device comes with a carrying case EXCEPT HT's??? If my W2A had come with one or my local HRO hadn't been out of stock, my drop test wouldn't have resulted in near as much damage...

A 6-page sidebar?

>If QEX can't
>succeed as a standalone publication, it should be folded back into
>QST. I hope it *can* survive as a standalone publication, but I won't
>accept it as an appendix.

Then don't read it. But I think you'll be missing some useful--and
improving--material. QST is not soon going to publish 100+ pages of
technical material of the kind you would like to see. It's just not
what the bulk of the readership wants or needs. Faced with that
reality, why not do the next best thing and at least put the material
somewhere? Given the available page space, which is determined by
the economics of publishing, this method lets us devote more total
pages to worthy projects than we could do in either QST or QEX alone.
Each article stands alone, by the way. You don't need to have one
to get the benefit of the other one.

Msg #1106 From: NT2X Date: 10-Aug 0222Z Subj: ROMEO'S P.O.BOX IN BROOKLYN

ROMEO HAD OPENED A P.O.BOX IN BROOKLYN, NY, WHEN HE WAS VISITING THIS COUNTRY THIS SUMMER. THE ADDRESS IS: ROMEO STEPANENKO, BOX 766, BROOKLYN, NY 11230, USA. THIS BOX IS IN EFFECT ROMEO'S MAILING ADDRESS FOR AH0M LICENSE. IT WILL BE USED FOR HIS OTHER OPERATIONS, NO DOUBT. CURRENTLY, IT IS TO BE USED FOR 9D0RR QSLING, FOR WHICH I'M GG TO BE A MANAGER. HOWEVER, I DON'T EXPECT LOGS FOR HIS PAST OPERATIONS. CARDS RECEIVED AT BOX 766 WILL BE RETRIEVED BY ME AND THEN PROCESSED - OR HELD UNTIL FURTHER NOTICE FROM HIM. I DO NOT EXPECT TO BE ISSUING AH0M, XY0RR, YA0RR, 3W3RR, ETC. QSLS.

CURRENTLY, 1S0XV AND 1S1RR ARE AVAILABLE FROM W4FRU; 1S0RR AND BOTH YA0RR - VIA W8BLA; XY0RR - VIA BULGARIAN ADDRESS. AH0M CARDS WILL BE HELD HERE AND AT W1-QSL BURO (BY SPECIAL ARRANGEMENT). DO NOT FORWARD AH0M CARDS TO THE SAIPAN ADDRESS. 9D0RR CARDS WILL BE PROCESSED BY ME AND ISSUED HERE, IN THE USA. 73 DE ED/NT2X

'scuse me for butting in here, but I know the individual in
question...

In article <1992Aug13.033623.1507@ke4zv.uucp> gary@ke4zv.UUCP (Gary Coffman) writes:
>...noise and Nintendo games on their digital display. There's a certain
>elegance to a HT200 that's missing from today's digital scanners that
>try to masquerade as *radios*.

The only elegance an HT200 has is that it takes both hands to hold it
up! :-)

I think what Jay is trying to say is that some "engineering" is done
simply for the sake of engineering, not to make the product any
better, only more elegant.

I see the same effects in the broadcast world. I've got two shiny new
25kW transmitters that have neat CMOS controllers. When the lightning
flies, these units choke big time...while my 20 year old klunker
backup full of latching relays comes up every time. Is the CMOS
controller better? Probably. Is it more elegant? Definately. Is
it more reliable? No.

The point is, there's a place for elegant engineering, and a place for
brute force and ignorance.

The DTMF level pot on the IC-2GAT is located on the front panel PC board. If you've never dissassembled one of these before, be careful not to ruin the switch cover. It can be easily broken.

The DTMF pot will be the only pot on the front board. It's a surface mount trimpot about 3/16" square.

Good luck.

>told so far to do take these measures: use a sharp bit, wax the area heavily,
>and use RV silicon to seal the mounting. Any other things I need to watch
>out for?

I drilled a hole in my roof about 4 weeks ago. Since I had a complete set of twist drills, including 3/4 inch, several sizes between 3/4 and 1/2 and complete set from 1/2 inch on down, I just started with a very small drill and kept working my way up.

The only problem I had (minor) was that I drilled the hole right behind my interior dome light. It appears that the roof had an extra layer of metal to it near the light as part of the light support. So I had to work my mount through a slightly thicker surface. But once I got it in, it is solid..

That Diamond SG-7900 in the center of the roof works GREAT.. I just gotta watch out for those low tree branches :-)

2205. QST, in my opinion...

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 20:47:59 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <l8lijvlNN5lp@west.west.sun.com>
Source record: 285778

QST is first and foremost, a club newsletter. Second, it's a revenue source and third, it's a technical contest journal. Let's examine these points.

QST is the ARRL. Technically, I'm a member of the ARRL, but in reality its just another one of the many magazines that I receive each month. In some way, to "subscribe" to QST is to subscribe to League policy so the term subscription really takes two meanings here. One might say "I don't subscribe to their policy...", but they may still subscribe to the magazine, which, like it or not, supports that policy.

On the very first few pages, just past the initial advertisements (which cost upwards of $1200 per page), the magazine begins. First up, (on page 3), the Table of Contents. Then, a few ad pages later, the first club item: a listing of club directors and section managers, their territories, names, addresses and telephone numbers. Immediately following is the opening editorial, which as of late has become the David Sumner, K1ZZ pontification page. Dave must be one heck of a ham however, I get the feeling that you'd be more likely making a space shuttle contact than actually hearing him on the air. Have you ever noticed how many 1-landers have been League executives? Somehow I don't get the impression that Dave has ever been seen without his suit and tie, God forbid wearing just jeans and a t-shirt, using an old IC-2AT at the local hamfest. Just who is this guy anyway?

Next, Up Front in QST. This is the only non-revenue color section in the entire magazine. I thought that the July 1992 edition was particularly lame here, starting out with a couple of (yawn) antenna pictures, a bunch of nerds holding coffee cups, an inside photo of a QRP rig, 36 different QSL card styles from the same ham, and four "humor" photos including a canned ham, and a water cooled CW key. Now here's some real eye catching stuff.... Now, when am I going to get my ARRL pocket pen protector?

Next comes League Lines, a pseudo headline news section replete with one liners about the "industry". Here, I almost expect to see a blurb at the bottom regarding professional opportunities at Hughes. Same sort of format as Hughes uses in their advertisements.

The first real article is usually a construction project. I generally like reading these but I must admit that in the past 3 years I've built only one of them (the CMOS Super Keyer). Still, they're usually pretty good reading, except when they go off the deep end on something like spread spectrum stuff or the like. I don't particularly care for construction articles for which it's unlikely that anyone will _ever_ build them except the author. Maybe someday I too will own a spectrum

analyzer... Overall, the QST construction articles have great schematics and good technical theory, but usually end up promoting either the author or a particular parts supplier for that "unique part". After having criticized QST for publishing a microprocessor controlled project for which no source code was available, I've noticed now (July 92 Keyboard Keyer project for example) that this may be changing for the better.

One of my favorite areas are the Product Reviews, however, there tend to be too few of them. I greatly admire QST's efforts to be as non-subjective as possible, and present only the facts. It is evident, however, that some advertiser pressure still exists, but I honestly don't think that it can be avoided. Overall, however, I "trust" QST reviews more than I do those of any other magazine's. I don't trust them completely, however, and do reserve final judgement on any product to my own investigations. Usually, their technical analysis of most gear is the best anywhere, given their excellent lab. Hats off to their lab staff!

There are 4 main topic areas in QST, listed each month in the table of contents. They are TECHNICAL, NEWS AND FEATURES, OPERATING and DEPARTMENTS. The technical stuff is generally pretty good, however I usually find that the theory is either too simple or too difficult. They need more middle of the road, middle skill type projects which produce articles that the typical ham can actually use. The trouble with this lies in how many J-Poles, dipoles and QRP rigs can you write about? These subjects are nearly worn out and I commend QST for trying to keep it interesting.

The NEWS AND FEATURES articles vary greatly in appeal. The general theme of this category of articles serves to paint a picture of the ideal ham as being a "God, country and apple pie" kind of guy. Here you have your "How CW stopped a runaway locomotive", "My first elmer" sort of stuff, "How to be prepared for that great simulated emergency", "Why public service is our calling in life", and "How the ARRL is working with the FCC on regulatory issues of galactic proportion".

Next comes the OPERATING section. "Operating" is an ARRL codeword which means CONTESTING. Contesting appears to be a real money maker for the league since they must spend upwards of $10,000 a month in page space promoting it. They list not only their contests but also those of other organizations such as _CQ_ and JARL. Contesting must kill an awful lot of trees, both in QST pages as well as QSL cards. Let's not forget the fossil fuels which are consumed to deliver them. I thought this hobby was supposed to work in the ether, the thin air... It seems that a significant number of hams simply must have tangible proof that their signal really did travel around the world at the speed of light. Myself, I feel quite satisfied reviewing my own memories and my log book. I don't have a QSL card...

Next comes the DEPARTMENTS. In general, a "department" is defined as any special interest or politically correct topic which takes less than a page to satisfy. There are some (to steal a phrase used before in this

forum) perrenial "tree killers" like Section News and Silent Keys. Section News can't be politically eliminated, so they just use smaller type. A Monty Python "hell" would be a condemnation to spend the rest of eternity reading nothing but Section News pages.

The Silent Keys section seems to be expanding of late, probably due to the demographics of our hobby. Let's face it, there are proportionally more OF'S in this hobby than possibly any other. OF's have a nasty habit of expiring, and taking a tree or two with them when they go.

As a revenue vehicle, QST is certainly pro-commercial, almost in an uncanny way. While on the surface they would lead one to believe that commercialism has no place in amateur radio, they themselves are some of the biggest commercial interest whores anywhere. Their magazine is a full 50% paid advertising, and one of their biggest advertisers is: The ARRL. Yes, the ARRL routinely takes upwards of 10 pages to promote their own products, mostly books and the like. The next biggest is Ham Radio Outlet, which practically owns the 6 pages after the regular article section. I've never heard of HRO, or any advertiser for that matter, being criticized within QST. Hmmmm.

QST has, shall we say, a _special_ requirement for all advertisers. QST, unlike all other amateur radio related publications, requires that advertisers be willing to submit samples of their product to ARRL for evaluation as to fitness for service. In other words, a company selling "Antenna Wax" is not likely to get advertising space. Is this good? Well, yes and no. For one thing, the ARRL is suppressing free trade, freedom of the press and free speech by denying these advertisers. Secondly, I resent having the ARRL act as my benevolent protector in shielding me from snake oil vendors. I'd like to see all of the products on the market, not just the ones which have been proven "safe and effective" by independent juries. I'm wise enough to spot incredible claims, and there is federal recourse in the event that mail order vendors become fraudulent. Thank you, ARRL, but please allow me to make value judgements for myself.

League Membership

When the ARRL puts its support behind or against a political issue, they will always quote the will of its membership as its guiding principal. In other words, they act as if we all had voted on the issues it addresses. Well, unfortunately, the "voice" that the ARRL hears is often the "squeaky wheel", which as always gets the most grease. It's a fact that more people write letters when they're mad versus when they're happy about something. If the ARRL gets 1000 negative responses to an issue and 200 positive ones, the issue is declared to be "rejected by the membership". Well, in an organization with more than 100,000 members, how can a 1% voice be considered "representative"?

I've never met a section manager or district chief, and don't even know who my local representatives are. In todays age of instant communications, who needs this archaic and anachronistic structure

anyway? If the ARRL wanted a truly representative vote on what really matters to their constituency, then they should spend about $1 per member to send out Business-Reply-Mail, postage prepaid, check-the-box bingo cards to each of the members soliciting their votes. Look, I'm sorry but in today's age, most people don't have time to call section managers, write letters and campaign for change in the old way. Checking squares on a bingo card and dropping it into the mail is a method which _really_ works, and is more in tune with our times.

And finally, the name QST is the epitome of hobby-jargonism. What a wonderful way to encourage passers by at the newsstand to pick up a copy. QST is a term which is instantly recognizable by all members of society, one which conveys instant meaning in an intuitive fashion. NOT! While the ARRL is considering changing their name, why not give the magazine a work over too? How about something like "The Journal of the Axxx", whatever Axxx eventually turns out to be?

Well, that's it, my opinion of QST. Any comments?

>As an artist, I must loudly disagree with the statement by KE4ZV. Artists
>do, indeed, understand why they are doing something.

Perhaps. Let's take an example. Eddy Van Halen taps a guitar string
rather than plucking it. He knows "why" he does it, because it gives
him a sound he likes. But he doesn't know "why" it gives him a different
sound than plucking. He just tinkered around until he found something
he liked and then kept doing it. On the other grasping member, give an
engineer an arbitrary acoustic waveform to generate, and he'll engineer
a method to do it *and* be able to tell you *why* it generates that
waveform. There are different levels of "why" operating here.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

2208. Re: Antenna drilling

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 21:15:02 UTC
From: vail@tegra.COM
Message-ID: <3517@atlas.tegra.COM>
Source record: 285787

In article <16e1spINNcek@network.ucsd.edu> brian@ucsd.edu (Brian Kantor) writes:

The best tool for drilling an antenna hole in a car is one made for the
purpose. The Motorola antenna tool is superb - it starts with just a
centerpunched dimple, drills the pilot hole, then saws out the 3/4"
hole, and polishes the paint off the perimeter of the hole so that the
NMO mount makes good contact, all without snagging the headliner
- and all in one operation!

and it is magnetic for removing the cutout and some chips.

Your local two-way shop probably has one. Perhaps they'll let you
borrow it, or maybe they'll do the hole for you for a nominal fee.

or just take your car with the headliner loose and the hole already
"dimpled" and buy the antenna mount from a 2-way shop. they should be
happy to drill for you. it literally takes less than a minute for
them if you have it ready beforehand.

then you take the time later to run the cable, etc.

worked for me.

Otherwise, use a Greenlee punch. You'll wish you had.

definately the next best thing.

;>work here. So, exclusively for Internet readers, this is it:
;
;Presumably Wally is the Wally? I always wondered why you chose those
;names, now I can ask the author.
;
;Does "a wally" mean the same in the USA as it does in the UK?
;
;I get my QST by surface mail so it tends to arrive over a month late. How
;about an article on exporting USA equipment, at USA prices to the rest of
;the world.
;
;Credit cards seem the best way to do it.....but what about customs
;clearance and shipping?
;
;Are USA dealers happy to supply overseas? Can the USA taxes be deducted?
;

I have no idea what "wally" means in the UK, and, after
reading this posting, I'm not sure I want to.

"Wally and Mike" is a series of fiction pieces appearing
in QST, purporting to help old timers deal with newcomers.

The late Wallace I. ("Wally") Youngs, K2IHO, was a neighbor
of mine when I got started in ham radio. He was also a role
model, father figure, etc, etc. I picked the name "Mike"
because it sounded All-American.

Speaking of all this, I'm running out of call signs to use.
Anyone care to "donate" a call?

I have bad feelings about an article on exporting American-
made equipment. Most of the major American manufacturers
have overseas outlets, and would probably get sued by
these outlets if they circumvented them. I realize the
```

VAT in England is steep, but wouldn't you still have to
pay duty?

If you insisted, I'm sure a VISA, MasterCard or American
Express card would be the way to go. Your account would
be billed in pounds-equivalent to the dollars.

Maybe other readers have better ideas on exports to Europe.

By the way, I've been on vacation, which is why it took me
so long to answer. 73, Jim

2210. mail alias for old rigs

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 21:40:39 UTC
From: lockwood@acidqueen.Eng.Sun.COM
Message-ID: <16eksnINN6gi@smli.Eng.Sun.COM>
Source record: 285782

I've created an email alias on my machine specifically to be
a distribution point for messages concerning old rigs. The
name of the alias and the means to reach it is:

boatanchors@acidqueen.eng.sun.com

The purpose of this alias is primarily for discussions concerning
old, heavy, glow-in-the-dark, fire-bottle-based boat anchors with
names like Hammarlund, National, Heath, hallicrafters, Gonset, etc.

Older models of rigs with names like Kenwood, Icom, Yaesu, really
aren't what I have in mind for this group.

My intention is to maintain the alias and add people to it
as/if/as if demand warrants. I don't intend for it to be a
moderated alias, but let's keep message lengths reasonable and
flames in /dev/null, where they belong.

If you have an interest in this and want to be added to the
alias, send mail to me:

lockwood@acidqueen.eng.sun.com

73,

Jim - KM6NK

2211. Would like any mods for Yaesu FT-5200 mobile.

Newsgroup: rec.radio.amateur.misc

From: gary@kimbark.uchicago.edu
Message-ID: <1992Aug13.214220.5987@midway.uchicago.edu>
Source record: 285799

The "Yaesu days" sale at Amateur Electronic Supply put me over the end, do I picked up a FT-5200 at $40 off... I think the bottom line price was $569.

So, anyone got any mods for this radio? Esp interested to get it to receive into 460Mhz so I can monitor the local police.

Thanks,
Gary

;Lines: 24
;
;In article <382@arrl.org> ehare@arrl.org (Ed Hare KA1CV) writes:
;
;>If you are unhappy with League
;>policy in any matter, make your views known to your Division Director. I
;>have seen too many ARRL Forums at conventions that are attended by less
;>than 1% of the convention attendees! (These are mainly the OFs who are
;>too enfeebled to walk around the booth area looking for bargains :-) :-) ).
;
;I've heard this point brought up a number of times. Has anyone
;seriously considered WHY the ARRL forums are so poorly attended? From
;what I've heard, other such forums (packet radio, satellites, etc)
;which many not appear to the wide spectrum of the amatuer population
;generally don't seem to have difficultly attracting attendees.
;
;Thought I've not been an ARRL member for more than a decace, I know
;that I wouldn't be attracted to a forum which effectivly bills itself
;as "come piss and moan at the ARRL - let us know what you think."
;What's in it for me? Is there some organized agenda, such as "ARRL
;seeks input on HF packet forwarding" or "ARRL discusses new VE
;procedures." If it's crap shoot, who's going to gamble that showing
;up won't be a waste of time?
;
;louie, WA3YMH
```

Some hamfest ARRL forums are organized to appeal to people
in the "field organization," others are free-form. They're
kinda like open season, where you can throw rocks or roses.
I think fixing an agenda is a mistake. Louie's interested
in packet forwarding, but Jim's interested in something else.
If the agenda says "discuss packet forwarding," I'm going
back to the flea market.

The ARRL forum is THE place to confront your elected
officials, ask hard questions and make suggestions. It may
not be the perfect way, but it will work if you take the
initiative to go and make yourself heard.

Of course, you could always suggest and moderate a forum of
your own, to which you could invite the director.

2213. GAP vertical antenna

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 22:07:33 UTC
From: rdewan@casbah.acns.nwu.edu
Message-ID: <1992Aug13.220733.28007@news.acns.nwu.edu>
Source record: 285785

Is the GAP antenna an elevated monopole?

I have not examined the antenna in detail - just a cursory glance at
Dayton. It seems to be an elevated monopole with a cage to make it
broad-banded.

The center portion of an elevated monopole, as described in Jasik's
Antenna Handbook, (and others too) is shown below. The bottom
mast is grounded at the bottom. The mast may be surrounded by
a cage to make it broadbanded. Further, an impedance matching
tranformer may be part of the feedpoint and located inside the mast.

```
| | top mast
| |
| |
| +---|
| | |
I | I insulator
| |||--|
| ||| |
| ||| |
| ||| |
| |||<---- coax feed line
| ||| |
| ||| |<- lower mast - grounded at bottom
```

Also from the Antenna Hanbook, the broadbanded version may have frequency
range of 4:1 and it does not require radials. Its principle of operation
is not dissimilar from that of a discone.

From the GAP antenna brochure, the Challenger VI (?) works on 40-10 (except
30) and on a portion of 80. On the 80m band it requires radials and may
be working in a simple monopole mode. The basic frequency range, other than
operation in a portion of the 80m band, seems to agree with the
characteristics of an elevated monopole.

So is the GAP antenna a broadbanded elevated monopole?

BTW, I am interested in hearing about other commercial, seemingly complex,
antennas. The Butternut HF2V is an interesting design too with cleverly
designed traps. But that is another story.

I would like to hear your thoughts.

Rajiv
aa9ch
Address: r-dewan@nwu.edu

Phone: None. Only CW.

Note: It is not my intention to infringe on the rights of GAP Antenna Products Co. I do not own a GAP antenna, have never physically touched one and probably may never own one. My only interest is in understanding how these antennas work.

2214. Re: FT-470 intermod fix ... Can you tell?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-13 22:53:02 UTC
From: summers@hpspkla.spk.hp.com
Message-ID: <30690015@hpspkla.spk.hp.com>
Source record: 285788

Another way to tell is to hook up a spectrum analyzer to the antenna input (Be careful not to transmit!!!) and look at the first LO leakage. It is very easy to see on my radio (about -50 dBm). The first LO will be offset from the receive frequency by the first IF frequency. At 144 MHz the LO will be at 165.7 MHz. For receive frequencies above 157 MHz, low side injection is used.

You are correct that the new IF frequency is 21.7 MHz, however I had the Yaesu technical guru tell me it was 21.15 MHz this moring. It turns out that the part number for the new part is 21R15AU and he got confused. The changes done in the modification are as follows:

RF Unit: XF2001 was 17N15AU and is now 21R15AU
XF2002 was 45N15A1 and is now 47M15AU
L2007 was 4.7uH and is now 3.3uH
L2008 was 4.7uH and is now 3.3uH

IF Unit: X3001 was 16.845MHz and is now 21.245MHz
X3002 was 44.615MHz and is now 47.265MHz

The service manual does not show these changes.

By the way, I don't think the IF change did anything to the intermod performance of the radio. A friend has an unmodified radio and it checks out exactly the same as mine. The problem here may be terminology. The front end intermod performance is primarily determined by the mixer and the LNA. Intermodulation produces a signal at the desired receive frequency which will be converted into the IF no matter what the IF frequency is. I suspect the actual reason for the change was to move a spurious receiver response out of a commonly used public service frequency band.

After a few weeks of experience, I have found that all of my favorite repeater frequencies have intermods or spurs of one order or another that will break the squelch even when I am using the rubber duck antenna (really bad on a quarter wave ground plane). I hope this will be fixed in their next dual band offering, but I am sure I won't be buying one... This has not been an enjoyable experience.

>in a 1947 issue of QST, I believe.
>
Years ago I first saw a Wullenweber for IFF (1000 MHz or so) - maybe 25
ft. in diameter - pretty nifty gadget I thought at the time.
Several years later, here I am driving along on some back road
in Germany, going to visit some friends in Augsburg...what to my
wondering eyes should start to appear on the horizon but this incredible
monstrous antenna assemblage. "Holy Modal Rounders" I sez, "it looks like
an HF Wullenweber" !!!! It seemed like it was miles in diameter !!!
Sure enough, my friend in Augsburg just smiled when I told him
about seeing this monster. "Now you know where I work" he said -
"unfortunately I can't tell you what we do there".
Anyone know more about what this monster really is and what it
is being used for now ?? - I assume listening to the Red Army isn't quite
as passionate a hobby as it used to be.

2218. Code Free License

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 00:42:09 UTC
From: jkearman@arrl.org
Message-ID: <409@arrl.org>
Source record: 285775

Erik Sorgatz posted quite a response about this subject. I won't repeat it here. In that response, he blames ARRL for "shouting down" FCC's proposed no-code license in the 1970s. Sorgatz goes on to imply the League misused our "members' opinions" as a rationale for our position. Erik made several valid points in his posting, but I would like to address this particular part of his lengthy posting.

1. Assuming the League's directors had no popular support for advocating the status quo in the 1970s, why would they do so? Those who absolutely hate the League because of the no-code license claim we advocated it to get more members/money. Was ARRL less interested in growth in the 70s? I know what the starting salary in the Technical department was in 1975 ($7200/yr), so I think the staff would have been happy to see more bucks coming in! Again, what purpose was served back then, if not to represent the feelings of the membership at that time?

2. Prior to my first hitch at ARRL, which began in December 1975, I lived in New York City. A National Convention was held in NYC in 1974. The site was the Waldorf Astoria hotel. The ARRL forum was held in the ballroom. You've seen the ballroom if you ever watched Guy Lombardo on New Year's Eve. It's a B I G room, and it was nearly full. Then-ARRL President Dannals spoke very favorably about the no-code license and the positive effects it would have on Amateur Radio. At the end of his presentation I rose and questioned this decision, rather forcefully as I recall. The room went wild. It seems that the far majority of hams in that room were, like me, opposed to a no-code license. It would seem that what I and others have said about getting out and letting the Board know what you think does work. If Dannals didn't have the backing of the Board in 1974, I seriously doubt he would have made the statements he gave at the National.

Since that time, I have changed my attitude about no-code licenses. I'm not convinced the hobby was ready then, but that's ancient history. What's interesting is, Harry Dannals went on to become president of QCWA, whose proposal for a no-code license was accepted, almost verbatim, by FCC.

3. Amateur Radio is not a one-area hobby, and the League is not a one-issue organization. Any decision has pros and cons,

and also advocates and detractors. For every "I hate the ARRL because they prevented the code-free license..." posting I have seen, I have seen a letter from someone who's threatening to quit because we allowed code-free licenses to happen. I just can't see how people get these paranoid ideas that the League is out to kill or injure the hobby. The Board and the staff care. We try to provide leadership when it's needed, but we also try to give the people what they want. Very often we're damned if we do and damned if we don't, but we keep trying.

It's easy to sit in New Hampshire or elsewhere and point the finger at us. It's a lot harder to implement than it is to criticize. You'll have a lot easier time getting action out of the League than you will out of the political process.

Oh, how I envy the National Rifle Association! So long as the various anti-firearms groups continue, shotgunners, hunters, riflepeople, pistol people (action, bullseye, silhouette) and so on, (bullseye and action pistol shooters have little use for each other's disciplines, for example) will hang together against the common enemy. I almost wish Amateur Radio had such a common enemy. Then we could stop all this hate mongering and have fun again.

2220. HELP! In Need of ....

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 02:06:22 UTC
From: jdelancy@tecnet1.jcte.jcs.mil
Message-ID: <9208140148.AA23511@tecnet1.jcte.jcs.mil>
Source record: 285797

Can anyone point at a source, or have (for sale, beg, borrow, lend,
or give away) a relay for a Collins 30S1 Amp that's called the
PLATE CONTACTOR RELAY (in working order of course) ??

I also understand that a group called Collins Collectors exist.
Does anyone know about them, i.e. how to get to "know them"?

Any leads appreciated..

>A 200 foot mast with sloping veebeams running in all directions which are

Zardoz is correct. I came across a Wullenweber design recently and as these are interesting, thought I'd add my own two bits (and a schematic):

```
NW N NE
\ | / /
\ | / / = antenna
\ | /
_ _
W ----- ( ) ----- E ( ) = rotating commutator
5P5T (see text)
/ | \
/ | \
/ | \
SW S SE
```

Since the antennas are in a radial pattern (verticies of a regular N-gon), the entire structure is periodic every 360/N degrees. The trick lies in the central commutator, which in the picture is making contact with only five elements: W, NW, N, NE and E. Rather than being a single pole piece, it is a 5-pole 5-throw switch, in which the five poles are connected to the common source of RF using cables whose lengths have a distribution looking something like this:

```
|- edge pole
|------
|--------- center pole
|------
|-- edge pole
|
^ point of common drive.
```

This means that with the commutator in the switch position illustrated, the W and E elements are driven essentially from the common feed-point (with a bit of connecting cable having length '-') and begin radiating outward. When the

wafefront passes the NW and NE elements, they likewise present an in-phase wavecrest, as their RF energy arriving via the 5-pole commutator presented a longer delay: '------'. The center feed receives current last and hence is the last to radiate. Note that the distribution drawn is a lobe of a sine wave for firing due north ("broadside" along a line through two opposting vertices), as this presents the phase delays of a leaving (or arriving) wavefront.

Rotating the switch one position to the left (CCW) moves the shaped beam to the NW direction, etc. A true system will provide many additional antennae and the spread of the commutator will likely not be through 180 degrees, as shown for illustration here. (I picked "5P5T" as an example).

When used at UHF frequencies the Wullenweber can drive into a central reflecting hub (a coaxial cylinear suitable distorted along the Z axis but showing radial symmetry) to beam (un)shape along the Z axis as the basic Wullenweber only steers radially (in the XY plane).

A more modern design uses Butler arrays to provide an N-by-N port (eg, 8x8) in which excitation is presented to one of N inputs and then all N outputs (which drive the radiating elements) provide a properly phased beam at eight discrete locations, arranged radially (ie, end fire left, through broadside in one direction through broadside right in 22.5 degree steps). Such arrays use "magic Tees" and other hybrid couplers (power dividers). A basic element is a 2x2 port when driven at In1 provides 50% inphase output at Out1 with 50% going to Out2 with a 90 (or 180) degree phase lag. Driving In2 likewise presents 50% inphase to Out2 with 50% going to Out1, AGAIN with a 90 degree lag. The Butler array builds these into larger structures much as the phone company builds up NxN crossbars having less than N^2 elements by using smaller crossbars and an interesting interconnection hierarchy. A much better model is the FFT butterfly diagram (which also provides "phasing" along points of a regular 2^N-gon).

At the high end, the modern top-flight (bad pun) phased arrays used in UHF avionic radar use ferrite or step recovery diodes to provide phase shifting. (These are called "phasers" in this application - no 'kiddin. ["Couldn't aquire lock on the enemy, Cap'n, my phasers must be burned out..."]). Here, active (circuit) elements -- RF amplification -- drive each antenna element. Then the phased array becomes a flat array of small transmitters in which each might not put out more than 5W. This keeps the solid-state RF drive simple, yet given a few thousand elements, many thousands of watts can be concentrated and directed along a select path. The return signal likewise takes advantage of the antenna gain along the common path. Some ferrite systems show "remanence" (as in the hysteresis of ferrite core memories), so that the array remains properly directed for reception of the reflected wave even after the steering signals have been removed.

My personal interest (and recent bedtime reading) in all this lies in designing a six-element driven vertical array for use on 432MHz. (I recently cornered the market on SPDT coax relays with silver-plated N connectors and want to build something worthwhile). I've seen a number of designs for four element "square" vertical systems with unidirectional radiation off the diagonals; if anyone has seen designs based on a regular hexagon I would be delighted to receive e-mail.

Content free communication. Something so many alleged masters
of communication are so good at. Of course the usual word used for
content free communication is "waffle". Some politicians are superb at
it. PR flacks are of course masters at it. They never offend, they
never inform, they never enlighten, they never make you think. This
is applied dullness.

Never be dull, to be dull is to be mediocre.

2225. Re: Orbiting FM Repeater ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 09:23:28 UTC
From: michaeln@hpcvnb.CV.HP.COM
Message-ID: <61250013@hpcvnb.CV.HP.COM>
Source record: 285825

the satellite with the crossband fm repeater is AO-21. I don't have the uplink frequency with me but it is not on a 5 khz step so you have to fudge alittle with a fm only dual band rig. I have listened to people using it. so use omni antennas and some us beams. the ones i was listening to were using beams and commenting on how much better it was over the omni's.
AO-21 also known as RS14.

2226. FT211RH Odd Repeater Shift

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 13:00:10 UTC
From: dplumb@cix.compulink.co.uk
Message-ID: <memo.576156@cix.compulink.co.uk>
Source record: 285808

A question... I have an FT211RH. On this radio, you have either a standard 600kHz repeater shift, or a programmable tx/rx on all channels. Fine for the UK, but I understand in France (where I may be holidaying shortly) they use some odd offset system.

The FT211RH manual mentions nothing about reprogramming the 600kHz split, but on a quick reference card, this is mentioned:

> Program Standard Repeater Offset
> Turn power off. Hold [RPT] while turning power back on. Tune display to
> offset, and press [RPT] to return to normal.

No matter how many times I've tried this, on the FT211RH or my FT23R (which has the same processor, buttons, and physically works the same) it just actions the "RPT" press by either putting a -600kHz or +600kHz shift on. Has anyone managed this, and does it require the addition of a link to enable this?

Source record: 285807

>Fred Lloyd, AA7BQ...

>habit of expiring, and taking a tree or two with them when they go.

fred - we can grow more trees. You'd have a more sound critique of the League and QST if you leave the enviro-wacko stuff out. Magazines today use thinner paper than ever and in general the amateur mags have less pages than they did a decade ago.

>happy about something. If the ARRL gets 1000 negative responses to an
>issue and 200 positive ones, the issue is declared to be "rejected by
>the membership". Well, in an organization with more than 100,000 members,
>how can a 1% voice be considered "representative"?

it's because it is representative. same thing with the federal government where only 535 people are responsible for making the rules for 250 million. (and sometimes as many as 4-5 billion people). squeaky wheels do get greased. It's also important to let folks know you think things are "just fine".

>I've never met a section manager or district chief, and don't even know
>who my local representatives are. In todays age of instant

Usually these gals and guys are "meetable" at major hamfests in your area. around here, the folks with official mantles seem to be fairly active and can be heard *actually on the air*.

>anyway? If the ARRL wanted a truly representative vote on what really
>matters to their constituency, then they should spend about $1 per
>member to send out Business-Reply-Mail, postage prepaid, check-the-box
>bingo cards to each of the members soliciting their votes. Look, I'm
>sorry but in today's age, most people don't have time to call section
>managers, write letters and campaign for change in the old way.
>Checking squares on a bingo card and dropping it into the mail is a
>method which _really_ works, and is more in tune with our times.

what about the trees you'd kill for the bingo cards? 8-) Bet that the past efforts to solicit a wide response on a topic show extremely poor returns (like everyone complaining now about the digital committee's HF packet proposals that were based in part on returns from a survey request made in the magazine).

>a copy. QST is a term which is instantly recognizable by all members
>of society, one which conveys instant meaning in an intuitive fashion.
>NOT! While the ARRL is considering changing their name, why not give
>the magazine a work over too? How about something like "The Journal
>of the Axxx", whatever Axxx eventually turns out to be?

QST used to say in large type "devoted entirely to Amateur Radio". This took up about 1/2 the cover space. When the change to 8-1/2 x 11 came about, this was reduced to something like a 14 point subhead under the QST logo. Probably a good idea since this was the era of "wet ink" and the mags were easily smudged in handling. CQ and 73 both have "Amateur Radio" at the top of their covers. But this is lost in the clutter given how mags are stocked in book stores.

Last I checked, QST wasn't available on newsstands. If anything, I would think they could cut some sort of deal with Radio Shack (maybe). There's one parts store in town that will have a couple of copies for sale. That's because they've "always" have had QST in the mags racks, but I don't think people go out looking for QST and I doubt that a serious business plan would say that QST would be a magazine to stock. I don't know if you could get it into a Wal-Mart or K-mart since they try to stock only what moves.

CQ and 73 are stocked at the book stores and news stands. With the single exception of Bookstop, CQ and 73 will either be behind the video magazines (typically Waldenbooks) or on the top shelf next to the Hustlers (B. Dalton) in their anti-peek packages and the other "adult" magazines. Bookstop has the communications mags about in the middle of their magazine racks. Again, the magazine racks are visually "noisy" so it's tough to have a design that commands attention.

>Well, that's it, my opinion of QST. Any comments?

How was that?

>
> Oh yeah, BTW, I ALWAYS carry my HT in a case. Practice safe hamming.
> WRAP that WRASCAL.

I too dropped my W2A, from about 3 feet...works fine, but scratched the front of the case and cracked the battery rail. Which brings up another point. How come every form of consumer electronic portable device comes with a carrying case EXCEPT HT's??? If my W2A had come with one or my local HRO hadn't been out of stock, my drop test wouldn't have resulted in near as much damage...

because then they couldn'e sell them as options or sell more batteries due to broken rails.

seriously, one problem is that different people prefer different size batteries. thats why the sell severl different sizes. I just wish they sold one like they did for the IC-24. That was a nice case.

I ended up getting one of the neoprene ones with the velcro strap. simple and effective and not "plasticy" like the Icom ones.

2235. questions about G5RV antenna

Newsgroup: rec.radio.amateur.misc
Date: 1992-08-14 14:16:50 UTC
From: rossi@gvlf9-q.gvl.unisys.com
Message-ID: <1992Aug14.141650.14408@gvl.unisys.com>
Source record: 285729

My cousin (N3LJB) recently upgraded from no-code to General. He bought a G5RV which he has about 12 feet off the ground. The feed line is running sort of parallel to the ground about 8 feet off the ground to the balun, then the coax slopes down a bit and into the basement window.

He has been trying 20 meters since that is the only band that has been useful in the evenings lately (too much summer static on 80/40). The SWR is a bit high on 20 but the transmitter seems to load up OK (old 100 watt tube rig) and he has been able to work a few stations but with difficulty.

Now, I live about 1/2 mile away from him. My 20 meter antenna is a simple 1/2 wave dipole less than 15 feet off the ground. I am using the same 100 watt transmitter as my cousin.

The difference between his G5RV and my dipole (both about the same height) is like night and day. In several pileups, I got through on the first call with my dipole and he never did work the station(s) after calling for 1/2 hour :-(

He tried adding a tuner, which seemed to help a little but really didn't make all that much difference other than lowering his SWR to 1:1. My dipole is about 2:1 in the phone band (without a tuner).

He is going to try to get his G5RV up a little higher this weekend but I am surprised that his antenna appears to be working so poorly compared to my dipole, with both about the same height.

Anyone have any experience using the G5RV at low heights? He may be able to get it up to about 30 feet this weekend but that is about all he can do with his trees.

Any comments on how to make the G5RV work any better would be appreciated.

>QST is first and foremost, a club newsletter. Second, it's a
>revenue source and third, it's a technical contest journal.
>Let's examine these points.

Gee whiz, Fred...yes, the ARRL is the largest amateur radio club in the country, and one of the largest in the world. I would venture that the JARL has a larger membership, however. It is fair and logical that a large club should have some kind of newsletter so that the membership can be informed. Most of the other large national radio organizations (RSGB, DARC, etc.) have newsletters as well. So what's the problem? It also seems fair and logical to allow advertisers to peddle their wares via a widely read journal, and it is fair and logical to charge for the advertising space to help offset the cost of producing QST each and every month. How many other ham radio magaizines in the U.S. have shown the same reliability and stability? How many pages did you find with contest scores last month? The month before? How many pages did you find announcing upcoming contests? How many pages was that compared to the rest of the magazine? How many pages were devoted to technical material? With all of the many different areas of interest in ham radio, there has to be some balance.
>
>QST is the ARRL. Technically, I'm a member of the ARRL, but in reality
>...Stuff deleted...

QST is not the ARRL - we the members are the ARRL. QST _is_ the journal of the ARRL. I have been a life member for 25 years. I am not especially vocal or active in the affairs of the League, but I could be if I wanted to be and had the time to be. I vote for Director and Section Manager when the elections are held. All of these folks are _volunteers_ and receive no salary. They do receive some compensation for their expenses, which is as it should be. If you can do better, run for Director or Section Manager and make some changes so that the ARRL is more to your liking. Do not expect all of the membership to share your point of view, however.

>On the very first few pages, just past the initial advertisements
>(which cost upwards of $1200 per page), the magazine begins. First up,
>(on page 3), the Table of Contents. Then, a few ad pages later, the

>first club item: a listing of club directors and section managers,
>their territories, names, addresses and telephone numbers. Immediately
^^

This is so that anyone can call or write his/her Director or
Section Manager. You are allowed to do this, if you wish. This
is one of the things that they sign up for if they run for
League office.

>following is the opening editorial, which as of late has become the

>don't get the impression that Dave has ever been seen without his suit
>and tie, God forbid wearing just jeans and a t-shirt, using an old
>IC-2AT at the local hamfest. Just who is this guy anyway?

Dave is more active on the air than you might think. He has been
an active contest operator for years, and back in the 60's his
call was K8ZND. It seems perfectly normal for the editor of a
journal to express his views somewhere in each issue. Just look
in any of the magazines, newspapers and journals that are
published in this country and around the world. What's the
problem? The ARRL has been based in Connecticut from the beginning,
so it is logical that the ARRL staff should be made up of mostly
New-Englanders. You will find that people have actually moved to
CT from other parts of the country to work on the ARRL staff, at
modest salaries, I might add. Getting back to Dave - he is an
excellent CW operator, and you can hear him in many of the CW
contests which occur throughout the year. It has been my pleasure
to have contacted Dave on many occasions. You are not likely to
hear him ragchewing on 14.313 about ARRL policies, however 8^).
Nor will you hear him broadcasting from W1AW promoting the ARRL.

>Myself, I feel quite satisfied reviewing my own memories and my log book.
>I don't have a QSL card...

Bzzzzt...sorry Fred, wrong answer here. Contesting is _not_ a money
maker for the ARRL, CQ or any other sponsor of a major or minor
operating event. It takes lots of folks to run a radio contest.
There is the promotion of the event, the judging of the entries,
the cost of the awards and the publishing of the results. All of
these things cost $$$$, and guess what - there are no entry fees
required from the contestants. There is no prize money awarded
either. Somewhat like the Olympic Games, but not on as grand a
scale. It is natural for humans to test their skills against one
another - this has been going on for mellinia and is not likely
to change soon. Another misconception about contests is QSLing.
Exchange of QSL cards is _not_ required. It is up to the contest
judging committee to decide if the contacts in a log are valid
or not. Cheaters are found out easily and are disqualified. The
exchange of QSL cards has been a part of amateur radio for a long
time. There are many awards available for those who are interested,
and the way to qualify for the awards is to collect QSL cards.
Good luck on changing this soon. You _are_ allowed to not have a
QSL card, and you are not required to QSL if you do not want to.

>how can a 1% voice be considered "representative"?

This is quite similar to our democratic process. Not everyone votes
either, so it is the majority of those who make their wishes known
that has a chance to control these situations. If the Officers

choose to ignore the majority, eventually they are chastised and
turned out of office. What's the problem?

A fine critical essay! But how about the Vision Thing? I.e., what SHOULD QST be like? What other magazines, ham or otherwise, have a format that would appeal to Hams As They Are Today? (People, Road & Track, Rolling Stone, Hustler?)

One thing that QST might do would be to have a "My turn" column for general opinion pieces, including hopefully some from Fred.

>>improving--material. QST is not soon going to publish 100+ pages of
>>technical material of the kind you would like to see. It's just not
>> ...

One thing I have always like about QST is that all of the advertising is
only at the very front and at the back.

PLEASE DON`T CHANGE THIS FORMAT *

There is nothing I hate more than some magazines (like BYTE) where you have
an articles spread out over 15 pages with a full page ad on every other page
in between (continued on page 14... continued on page 17... continued on
page 20... continued on page 23...) Very distracting :-(

Maybe that's why QST is considered a "journal" rather than a "magazine". QST
has a much more "professional" appearance.

Just my $2 worth :-)

Help appreciated:

I am looking for a rugged set of paddles to put with my QRP
backpacking setup. Schurr in Germany makes a set of
mini-paddles that are fairley expensive, but look real
solid. G4ZPY makes some but they don't look rugged enough.
The Vibroplex brass racer and certainly the Benchers would
never hold together.

Thanks

> With the HT on, enough signal should leak out to be detected
> as a tone in the SSB position. Tune to the old and new IF
> frequencies, and listen. You will hear the osc. singing !!!!

The oscillator you will here will not be at the IF frequency. It will be the second LO which will be at a frequency that is the difference between the first and second IF frequencies. If the radio has not been modified (original 17.3 MHz first IF) you should find this signal at 16.845 MHz. If the radio has been modified it will be at 21.245 MHz.

Another idea would be to listen for the first LO with a scanner receiver. If you program the receive frequency to 144 MHz, you should hear a signal at 165.7 MHz if the radio has been modified. Otherwise it will be at 161.3 MHz. The 470 will need to be near the scanner antenna of course.

I am leaving on a sailing/dive trip for the British Virgin Islands in 1 week. This was a last minute trip, so I have been busy making several arrangements. I don't know if it is possible, but I would like to operate my 2m rig while I am there. The trip is only a week long. Does anybody know if there is an agrrem ent such as there is with Canada? I figure it is a long shot, but with the USVI so close I thought it might be possible. If there is not such an agreement, can an operating permit be obtained simply? Thanks, Mike AA7HN

julian@bongo.info.com (Julian Macassey) writes:
> It would be difficult to to programme a repeater to block DTMF.

Actually, it's not difficult. An SSI-202 DTMF receiver chip will decode touch-tones in 50 ms or so, and can be used to mute the repeater's audio path. You get a brief 'blip' of TT and then silence. Typically decoders listening to the repeater's output won't decode that quickly, so you've effectively eliminated TT-paging from your repeater. Gets rid of the tones blasting out from people sitting on their TT-microphones as well.

If you put a 100 ms audio delay in your repeater as well, you can completely eliminate the TTs. Of course it'll sound rotten and make duplexing impossible, but hey, it's only a hobby.

Alan's (K6XO) retort was great and to the point! Yes, ARRL is kind of a fuddy, duddy organization. Yes, QST is not a journal for technical weenies. Yes, ham radio is made up of a bunch of old men, and so on.

BUT, the ARRL is our organizational God until something else comes along. It's been fairly responsive to the changing needs of hams e.g. litigation, lobbying, apartment dwellers, satellites, digital, no-code licensees, etc. The organization can't specialize in everything, nor can QST. Hence other specialized organizations (e.g. AMSAT) and publications (e.g. NCJ).

Our biggest single problem as a hobby, IMNSHO, is the FCC--both in enforcement (they don't do enough) and paying attention to ham radio (they don't) when it comes to allocating frequencies and so on. The ARRL will have to become more and more a lobbying organization which desires/defends a portion of the frequency spectrum alongside some very high-powered commercial folks who are doing the same. The big difference is: the commercial folks do/can make money with the frequency spectrum and hence have a rather different set of priorities than we do. And the ARRL is what we have to depend on, like it or not. So you might as well support it!
